
To post messages to the linux list, send email to:

`aprsspec@lists.tapr.org`

To unsubscribe from this mailing list, surf to:

`http://www.tapr.org/cgi-bin/lyris.pl?enter=aprsspec`

or send email to:

`lyris@lists.tapr.org`

with the following line in the body of the message:

`unsub aprsspec`

The host of this list is:

Tucson Amateur Packet Radio (TAPR)
`tapr@tapr.org`
`http://www.tapr.org`
8987-309 E Tanque Verde Rd. #337, Tucson, AZ 85749-9399,
phone 940-383-0000, fax 940-566-2544

Just so that you have all the commands neatly contained in one place, here is just about everything you will need to know. Note that this list is running on a Lyris server. Please be aware that the commands might be different from those that you are used to using on other list servers. (For more information on Lyris, see `<http://www.lyris.com/>`.)

1. First of all, almost everything that you might need to do on the server is most easily and effectively performed via Lyris's Web interface at `<http://www.tapr.org/cgi-bin/lyris.pl>`.
2. In case you do not have Web access, here are some key commands; in all cases, the default server address is: `<lyris@lists.tapr.org>`. Other addresses are shown where appropriate. Note that commands may be placed in either the subject line or in the body of the message:

SUBSCRIBING:

subscribe aprsspec your_name
join aprsspec your_name
alternate address: join-aprsspec@lists.tapr.org

UNSUBSCRIBING:

unsubscribe aprsepec
leave aprsspec
alternate address: leave-aprsspec@lists.tapr.org

SETTING MEMBERSHIP TO DIGEST MODE:

set aprsspec digest

SETTING MEMBERSHIP TO INDEX MODE:

set aprsspec index

SETTING MEMBERSHIP TO DISCUSSION MODE:

set aprsspec mail

TEMPORARILY SUSPENDING MAIL FROM THE LIST:

set aprsspec nomail

RESUMING MAIL FROM THE LIST:

(command depends on your preferred mode)

set aprsspec mail
set aprsspec digest
set aprsspec index

ACKNOWLEDGMENT:

set aprsspec ack
(sends you a confirmation message when your posts are sent)
set aprsspec noack
(no confirmation message when posts are distributed)

RECEIVING COPIES OF YOUR OWN POSTS:

set aprsspec repro
(receive copies of your own posts)
set aprsspec norepro
(do not receive copies of your own posts)

SETTING YOUR PASSWORD:

set aprsspec pw=mypassword
(where "mypassword" is the password you wish to set)

DETERMINING YOUR MEMBERSHIP SETTINGS:

query aprsspec

RETRIEVING THE CURRENT VERSION OF THIS DOCUMENT:

get aprsspec hello

MORE INFORMATION ON LYRIS'S COMMANDS:

help

POSTING TO THE LIST:

You must be a subscriber to post messages. Sending mail to this address will distribute it to all the members of the mailing list: aprsspec@lists.tapr.org

3. CHANGING YOUR SETTINGS/ADDRESS VIA THE WEB INTERFACE: To do this, go to <http://www.tapr.org/cgi-bin/lyris.pl> and click the link in the "Change Your Settings" section. You'll need to enter your e-mail address and password (if you chose one) to continue.

(If you've forgotten your password, you can type in your e-mail address in the field at the bottom of the page and click "Get password" to request Lyris to e-mail your password to you.)

At the following page, you can read messages, post a message, adjust your settings, or unsubscribe. From the settings page, you can change your status (MAIL, DIGEST, INDEX, or NOMAIL), choose whether or not to see your own messages, and choose whether or not you want to receive a separate acknowledgement via e-mail when one of your messages is posted to the list. You can also change your e-mail address if you need to. When you change your settings, make sure you click the "Save" button at the bottom of the page.

4. ARCHIVES: The aprsspec SIG archives are available on the Web, at the following URL: <http://www.tapr.org/sigf.html>
5. BOUNCED MAIL: One of the key features of Lyris is its ability to handle mail bounces transparently to the list owner; as such, bounced mail will be handled primarily by the Lyris list server.
6. POSTS/REPLIES FROM DIGEST USERS: You *must* change the Subject: line when replying to a digest; all posts with "aprsspec DIGEST" in the Subject: line will be rejected by the server (you will receive a "rejection letter" when this happens).

APRS(r) is registered to Bob Bruninga, WB4APR.

I have made several replies/comments to the APRSSpec sig, but they have not been transmitted yet because of a change in my network connection. I don't want to retype them and my email should be back up tomorrow (Monday) so I am going to wait and let them be transmitted tomorrow night.

Overall, I am quite pleased with the nature and types of comments that have been posted. Several things were just oversites (mostly on my part) and a several were clarifications that made lots of sense..

This is all good and exactly what we were looking/hoping for..

The end result will be a good solid document to work from..

This is going better and smother than I was afraid it might, so I am quite pleased with the process..

As to what my network change is, MY T1 is -FINALLY-!!! up and running!!!! I have to wait for my DNS names to catch up with the new network numbers before our anti-spam system will allow my email from my home account to go out..

RE: APRS Protocol Reference version 1.0, draft

Who is the intended audience of the release version of this document?
Will it be only for existing APRS authors or as a guide for those that
may wish to write new APRS applications, be they display or tracking
units?

With regards to reviewing the document, this DOES make a difference.

Thanks

Jeff

I was expecting some very basic definitions from the protocol which are not present-

Units should be defined..

(A moving object's speed should epressed in knots for example).

No where is there a mention of "... " meaning "missing or not parsed"

Is North 000 or 360 for a vector?

What is the maximum length of an on-the-air packet?

What is the end of line designator? (LF/CR or what)

I state again - all times should be in Zulu.

G'Day

One thing that I noticed was missing was DGPS being a legal destination. Given that DGPS also sent through UI, can we have it added to the list acceptable destinations. If there is a reason for it not being there, maybe include a footnote indicating why.

Also it would be good to include some information in this document on the MIC-E protocol.

The last page - The table... Is FANTASTIC!!!!

Overall good work. I will have a look at it some more this long weekend...

Darryl VK2TDS

Now to a comment by Hamish Moffatt VK3SB on the OzAPRS mailing list

This is a definite improvement on the documentation available to date. I think there is some clumsy wording and minor errors (eg the protocol is AX.25, not AX-25, datagram is one word, not data-gram or "data gram") which will lessen its impact.

I think the special T0 callsigns system (APmxxx, m is manufacturer code) is a poor way to encode manufacturer information. Frankly I don't see the need to publish the manufacturer and version number at all, but

especially not in the destination callsign. I would prefer that the destination callsign was a standard "APRS". I don't know what country has the "AP" prefix but I imagine they would have a pretty entertaining time using APRS there!

The spec says that MIC-E packages must be decoded by everyone, but fails to give any details or a reference to the MIC-E specification.

There's not a lot of rationale given in the document. I think this is important in any standard or policy document. For example it says that standalone trackers transmit to GPSxyz, where xyz is the icon. Two questions -- firstly, aren't icons a single character, not 3? and secondly, why the special callsign? My portable station is perfectly capable of sending to "APRS" like any other.

Unfortunately this is an attempt to document current practice; ideally all this could have been defined up front. IMHO there are far too many ways to report your position, which would make writing receiving software difficult to say the least. You have to parse grid squares, a lot of different POSIT formats, and then NMEA-0183 (GPS) sentences. I was pleasantly surprised to find that even javAPRS handles all these.

I suggest deprecating all destination callsigns except APRS (or perhaps all the AP* codes) immediately. It is too confusing and IMHO unnecessary to accept GPS*, SPC*, SYM*, a huge list of others, etc.

I am happy for this message to be forwarded around to anyone interested. Hope it is of some use.

73,

Hamish VK3SB

Page 6:

The inclusion of compress format in the paragraph on packet types is confusing. Compressed format is part of one of the other packet types:

>From Page 6.
...!DDMM.hhN/DDDMM.hhW\$... Fixed format (digipeaters) no APRS
=DDMM.hhN/DDDMM.hhW\$... Fixed but is APRS message capable
/DDHHMMzDDMM.hhN/DDDMM.hhW\$... Stationary, time of last fix
@DDHHMMzDDMM.hhN/DDDMM.hhW\$CSE/SPD/... Moving (with APRS)
@DDHHMMzDDMM.hhN/DDDMM.hhW\CSE/SPD/BRG/NRQ/.... DF report
[XXnnyy].... Grid Square
[XXnn]... Grid Square
/YYYYXXX\$csT Compressed format which can be used
in place of LAT/LONG/cse/spd in all
formats. /\$ are the ICON bytes and T
is a TYPE byte. See YYYYNNNN.txt

This seems to imply that a compressed packet is /YYYYXXX\$csT. But it is really part of one of posits types.

Normal: =DDMM.mmN/DDDMM.mmW\$PHGxxxx.... (also works for !)
Comprssd: =/YYYYXXXX\$csT...

Normal: @121234zDDHHMMzDDMM.mmN/DDDMM.mmW\$CSE/SPD...
Comprssd: @121234z/YYYYXXXX\$csT... (also works for /)

First, congratulations to everyone concerned in getting all of this
information into one place. It's a very useful starting point.

I'm compiling a number of detailed comments, but right now I have just
one fundamental comment:

The initials "APRS" have variously been described in different documents
to mean:

- #1: "Automatic *Position* Reporting System" or
- #2: "Automatic *Packet* Reporting System"

The spec we're discussing presently calls it #1.

I submit that as APRS is capable of reporting *much* more than just positions, we rename the spec to #2; i.e APRS is a PACKET reporting system.

Irrespective of the original/current meanings adopted by various people, I feel this is now the ideal opportunity to give APRS the credit it deserves for the very wide range of uses it has. Calling it just a "position" reporting system is not relevant any more and doesn't do it justice.

My 0.02c

Hi All- can anyone explain the use of "local time" in aprs. I cannot think of a use that does not cause problems outside of a very limited geographical area. Shouldn't all times be in zulu?

73 de kg5qd Dale

At the top of page 3, under Reserved DESTINATIONS, nothing exists for XASTIR, a released Linux based APRS display application written by Frank Giannandrea. (I am assuming the X-APRS designator was for the Sproul's Linux application, currently in Beta).

-Jeff

I just finished reviewing the Draft 1.0 Specification. I also just joined the discussion list tonight, so some of this may be repeating earlier comments I have not seen.

Here are some suggestions to help make the document more readable based on previous experience I have had with similar documents:

1) Examples on pages 4 and 5 can be changed to eliminate possible confusion:

CURRENT:

121234/ is local time 1234 on the 12th
121234z is zulu time 1234 on the 12th
WIDE:>121234zStatus

REVISION:

271234/ is local time 1234 on the 27th
271234z is zulu time 1234 on the 27th
WIDE:>271234zStatus

This eliminates the double use of "12" in two different field definitions.

2) On page 6, Position Report:

Add the = symbol to the list of position reports.

Move the indented @ lines from the list of types to the next grouping of lines, or better yet make them into a third grouping of examples.

Correct (if required) the "Stationary" label to "Moving" for the line 3
"/DDMM" reference.

CURRENT:

```
! Stationary Posit or Ultimeater 2000
/ Moving Position report
@ Moving Position report with time
  @280817/3610.19N/08414.99W-ccc/sss
  @151909z/4011.58N/07942.35Wv000/000/-300-<132>

...!DDMM.hhN/DDDMM.hhW$... Fixed format (digipeaters) no APRS
=DDMM.hhN/DDDMM.hhW$... Fixed but is APRS message capable
/DDHHMMzDDMM.hhN/DDDMM.hhW$... Stationary, time of last fix
@DDHHMMzDDMM.hhN/DDDMM.hhW$CSE/SPD/... Moving (with APRS)
@DDHHMMzDDMM.hhN/DDDMM.hhW\CSE/SPD/BRG/NRQ/.... DF report
[XXnnyy].... Grid Square
[XXnn]... Grid Square
/YYYYXXXX$csT Compressed format which can be used
```

REVISION:

```
! Stationary Posit or Ultimeater 2000
= Posit (APRS Capable)
/ Moving Position report
@ Moving Position report with time

...!DDMM.hhN/DDDMM.hhW$... Fixed format (digipeaters) no APRS
=DDMM.hhN/DDDMM.hhW$... Fixed but is APRS message capable
/DDHHMMzDDMM.hhN/DDDMM.hhW$... Moving, time of last fix
@DDHHMMzDDMM.hhN/DDDMM.hhW$CSE/SPD/... Moving (with APRS)
@DDHHMMzDDMM.hhN/DDDMM.hhW\CSE/SPD/BRG/NRQ/.... DF report
[XXnnyy].... Grid Square
[XXnn]... Grid Square
/YYYYXXXX$csT Compressed format which can be used
```

Examples:

```
@280817/3610.19N/08414.99W-ccc/sss    ... Give Explanation
```

@151909z/4011.58N/07942.35Wv000/000/-300-<132> ... Give Explanation
 /271234z3507.46N/07543.62W\$... Give Explanation

3) Page 6, Position Report: better define what !FIXED format is.

I assume that it is saying that the data format following the ! is "fixed" in the usual !DDMM.... format, but it is allowed to start anywhere within the first 40 characters of the data message. I assume it is not a FIXED position report (ie: non-moving).

4) On page 6 under COURSE/SPEED:

Include ranges and units of the data fields. I am guessing here, but CSE is in degrees over the range of 000 to 359, and that SPD is in Miles/Hour over the range of 000 to 999?

Note that the values of a, b, c, d, and x for PHG and DFS are defined in the next section.

Include an example of each. For example 270/055 would be due west at 55 MPH, and PHG1234 is 1 watt, 40 feet, 3 dB, and 180 directivity.

5) Page 7, POWER-HEIGHT-GAIN string definition:

Standardize the explaintion field, plus describe the value of the specific references (essentially making the definition an example at the same time).

CURRENT:

```
!DDMM.mmN/DDMM.mmW#PHG5360/WIDE...(identifying comments)...
|          |          | | | | | | |_____ makes station show up green
|          |          | | | | | | |_____ Omni (Direction of max gain)
|          |          | | | | | | |_____ Ant gain in dB
|          |          | | | | | | |_____ Height = log2(HAAT/10)
LAT        LONG      | | | | | | |_____ Power = SQR(P)
|          |          | | | | | | |_____ Power-Height-Gain identifier *
|          |          | | | | | | |_____ # is symbol for digipeater
```

REVISED:

```
!DDMM.mmN/DDMM.mmW#PHG5360/WIDE...(identifying comments)...
|          |          | | | | | | |_____ Makes station show up green
|          |          | | | | | | |_____ Direction of max gain      (Omni)
```

			Ant gain in dB	(6 dB)
			Height = $\log_2(\text{HAAT}/10)$	(80 feet)
LAT	LONG		Power = $\text{SQR}(P)$	(25 Watts)
			PHG = Power-Height-Gain identifier	
			# = symbol for digipeater	

6) Page 7, POWER-HEIGHT-GAIN table:

Add the label "Units" to the appropriate column.

CURRENT:

DIGITS 0 9 Equation

REVISED:

DIGITS 0 9 Units Equation

7) Page 7, HAAT definition:

Although ASCII characters above 0-9 can be used, their values are not defined. Add some examples to clarify, such as:

0 = 10 feet
 9 = 5120 feet
 : = ??? feet
 A = ??? feet

Maybe it's too late, but I cannot figure out how to mathematically calculate this progression using $\text{LOG}_2(H/10)$. However, it appears to simply be a doubling progression vice a log function. If so, then the table above would be:

0 = 10 feet
 9 = 5,120 feet
 : = 10,240 feet
 A = 1,310,720 feet

Is this a doubling function, or a log function? Are different people calculating their heights in different ways?

8) Page 7, Height value calculation:

It is stated that

$H = \text{ASCII}(\text{Hchar}) - 51$ converts it to a decimal value

will produce the numeric value of the height character. If the numeral 0 is ASCII 48, then to correctly calculate this number shouldn't the formula be:

$H = \text{ASCII}(\text{Hchar}) - 48$ converts it to a decimal value

or, $H = \text{ASCII}(0) - 48 = 48 - 48 = 0$
and, $H = \text{ASCII}(5) - 48 = 53 - 48 = 5$

9) Page 9 states that

"The call of the station sending the object should be attached to the object"
and "All receiving software must attach to the object the call of the sending station".

How is this done?

10) Page 9, indicating spaces:

In the OBJECTS definition, there are supposed to be a fixed 9 character object name. The format is then shown as:

`;OBJECT___*DDHHMMzDDMM.....`

For this examples (as well as others) the _ character is difficult to count as an individual character. Something like the following would probably better reinforce the character count:

`;OBJECTnam*DDHHMMzDDMM.....`
or `;OBJECTsss*DDHHMMzDDMM.....`

Where s is noted to indicate a space (either immediately following the definition, or as a general definition listed earlier in the document).

Other examples:

`:W3XYZ___:one line message text.....{345 (the {345 is the line#)`

becomes

`:W3XYZssss:one line message text.....{345 (the {345 is the line#)`
(where s = a space)

11) Page 11, ACK Message:

Standardise the case of the ACK in the discussion (Capitalizing it for effect could be mis-interpreted since the lower-case note is stated elsewhere, and therefore may not have been read or forgotten. Otherwise, reinforce the reminder.

CURRENT:

An ACK is just a message with the letters ACK# where the # is the message line number (following the { character at the end of the line).

REVISION 1:

An ACKnowledge is just a message _PROCEEDED_ with the letters ack# where the # is the message line number (following the { character at the end of the line).

or REVISION 2:

An ACK is just a message _PROCEEDED_ with the letters ACK# ("ack" in lower case) where the # is the message line number (following the { character at the end of the line).

12) And to echo the sentiment

>On page 6, at the bottom of the segment "Position Report"
>the referenced file, YYYYNNNN.txt (the compressed format as
>used on APRSdos, the Kenwood HT and APRSDIGI) is not included.

Although this reference probably stands on it's own merits, this and any other referenced documents (such as the NMEA-0183 reference) could be included on the web page along with the specification so that they may be more easily referenced.

Thank You,

Darrell Hale, N3KTP

The MIM telemetry definition was omitted. Also, its not clear
to me if MIM status and POSITS are the same as standard
APRS, if different they need to be defined. I have attached all
I have on the telemetry mode (from Bob).

TELEMETRY.TXT APRS TELEMETRY SYSTEM

=====

Document version: 8.3.8
Document dated: 27 Mar 99
Author(s): Bob Bruninga, WB4APR <bruninga@nadn.navy.mil>
ABSTRACT
TELEMETRY.TXT: Using the Micro Interface Module (MIM) for APRS telemetry.
 The MIM module is a complete telemetry TNC on a chip.

~~~~~

See Mic-E.txt      for how the MIM chip is used in the APRS Mic-Encoder  
See Mic-Lite.txt for how to make the MIM into a simple Mic-E

The MIM module is a complete telemetry TNC transmitter on a chip. It has  
a serial data port, 5 analog and 8 digital telemetry inputs. It outputs  
PTT and transmit audio AX.25 tones. The MIM was developed by Dr. Carl  
Wick, N3MIM, as a simple, light-weight, throw-away module for experimental  
balloons. WB4APR modified it for Mic-E operation and Dr. Will Clement  
refined it into a commercial product. It is now sold by APRS Engineering

LLC at the address below. The only external components besides the sensors themselves, are a transmitter and optional GPS and battery.

EXTENDED LIFE: For extended operation (up to a year or more), the MIM can be turned on/off with an external timer between reports. A single set of AA Alkaline batteries could power the MIM and 1 watt transmitter for a YEAR at one report every 30 minutes.

| MODULE      | INPUTS         | OUTPUTS            |
|-------------|----------------|--------------------|
|             | -----          |                    |
| Analog 1    | --0            | 0--> PTT to XMTR   |
| Analog 2    | --0            | 0--> Audio to XMTR |
| Analog 3    | --0            | 0                  |
| Analog 4    | --0  M.I.M     | 0<-- Rcvr Audio    |
| Analog 5    | --0            | 0<-- GPS NMEA data |
| Input bit 1 | --0  Telemetry | 0                  |
| input bit 2 | --0            | 0                  |
| input bit 3 | --0  Module    | 0                  |
| input bit 4 | --0            | 0                  |
| input bit 5 | --0            | 0                  |
| input bit 6 | --0            | 0                  |
| input bit 7 | --0            | 0                  |
| input bit 8 | --0            | 0                  |
|             | -----          |                    |

MIM PACKETS: The mim can operate in either MIM mode or MIC mode. Here are the packets in each mode:

|           |          |                                          |
|-----------|----------|------------------------------------------|
| MIM MODE: | STATUS   | packet transmitted every N seconds       |
|           | POSIT    | packet transmitted every P seconds       |
|           | TELMETRY | packet transmitted every T seconds       |
|           | CWID     | transmitted every C seconds              |
| Mic MODE: | POSIT    | packet every P seconds                   |
|           | STATUS   | text appended to posit every P/S seconds |
|           | TELM     | telemetry appended every P/T seconds     |

MIM TELEMETRY: Each telemetry value is a decimal number between 000 and 255. The user can adjust his sensors to meaningful values, or the telemetry equations can be modified on receipt. The on-air packet telemetry format is as follows:

T#sss,111,222,333,444,555,xxxxxxx where sss is the serial number followed by the five 3 digit analog values and the eight binary values.

BATTERY VOLTAGE: Just a simple 10k and 2.4k resistor divider connected

to channel 1 will give you a battery voltage reading in tenths of a volt. Thus, a reading of 138 would mean 13.8 volts. For precision, you might want to replace the 2.4K resistor with a pot to tweak the reading to an exact calibration.

TEMPERATURE MEASUREMENTS: Similarly, by proper selection of 2 resistor values and 2 diode voltage drops, you can easily make one of the Digi-Key \$2 thermistors read out temperature in degrees F. For details, run the MIC-TEMP.BAS program. It draws the schematic and allows you to select the proper resistor values. It is suggested that AD-2 be used for internal temperature just for consistency with the default APRS Telemetry Display.

TELEMETRY EQUATIONS: The real beauty of the APRS telemetry system is that you are not limited to specific calibrations as used above. APRS can display any other telemetry values according to any specific quadratic telemetry equation. For the ultimate in flexibility, APRS can receive on-air packets to define the Telemetry labels, units, and equations. Thus it does not need to be programmed for each application. These parameters may be transmitted to all APRS stations live via four one-line BULLETINS. The first one defines the telemetry labels, the second defines the units, the third defines the telemetry equations, and the fourth defines the project name and digital bit definitions.

LIST-TELEMETRY. To see telemetry data in APRSdos, hit the LIST-TELEMETRY command. Hitting this command causes APRS to scan the TRAFFIC page looking for telemetry equations, and then to scan the LIST-LOG page for any TELEMETRY values. The TELEMETRY samples are saved in the normal LOG files. A sketch of the APRS telemetry display is shown below:

#### APRS TELEMETRY FOR XYZ BALLOON LAUNCH

| SER<br>NUM | TIME | Battery<br>volts | AirTemp<br>deg.F | BTemp<br>deg.F | Pres<br>Mbars | Altud<br>K ft | Camra<br>BIT | Par<br>BIT | Sun<br>BIT | 10m<br>BIT | ATV<br>BIT | 5th<br>BIT | 6th... |
|------------|------|------------------|------------------|----------------|---------------|---------------|--------------|------------|------------|------------|------------|------------|--------|
| 101        | 1215 | 12.8             | 86               | 85             | 999           | 0             | ...          | ...        | ...        | ...        | ...        | ...        | ...    |
| 104        | 1218 | 12.4             | 84               | 80             | 980           | 4000          | clik         | ...        | on         | on         | hi         | ...        | ...    |
| 105        | 1219 | 12.3             | 80               | 76             | 900           | 8000          | ...          | ...        | ...        | on         | hi         | ...        | ...    |
| 106        | 1220 | 12.1             | 75               | 70             | 850           | 16000         | ...          | ...        | on         | on         | ...        | ...        | ...    |
| 107        | 1221 | 12.0             | 70               | 65             | 800           | 32000         | clik         | ...        | ...        | ...        | ...        | ...        | ...    |
| 108        | 1222 | 12.0             | 65               | 60             | 730           | 64000         | ...          | ...        | on         | ...        | hi         | ...        | ...    |

To configure all APRS stations to properly decode the telemetry from a M.I.M module, one station transmits the proper parameter definition packets TO the CALLSIGN of the M.I.M module. For example of N3MIM's MIM:

To N3MIM:PARM.Battery,BTemp,AirTemp,Pres,Altude,Camra,Chute,Sun,10m,ATV

To N3MIM:UNIT.Volts,deg.F,deg.F,Mbar,Kfeet,Clik,OPEN!,on,on,high  
To N3MIM:EQNS.0,2.6,0,0,.53,-32,3,4.39,49,-32,3,18,1,2,3  
To N3MIM:BITS.10110101,PROJECT TITLE...

The PARM format specifies the name of each of the 13 parameters.  
The UNIT format specifies what units are to be displayed, and what label is associated with the digital condition.  
The BITS format specifies whether a 1 or 0 indicates the indicated label and also the project Title.  
The EQNS format has three coefficients for each of the five analog channels.

Final value =  $A \cdot X^2 + B \cdot X + C$  Where X is the M.I.M transmitted value

FORMAL SPECIFICATION: The specific format for the TITLE, PARM, UNIT, and EQNS message packets are shown below. They are entered as messages to the address of the MIM module:

|                                     |                                                                                                                                                     |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| PARM.P1,P2,P3,P4,P5,B1,B2,B3,etc    | Where Pn and Bn are the parameter names                                                                                                             |
| UNIT,U1,U2,U3,U4,U5,L1,L2,L3,etc    | Where Un are the units for analog ports and Ln are the labels for the bits                                                                          |
| EQNS,A1,B1,C1,A2,B2,C2,A3,B3,C3,etc | Where the An,Bn,Cn are the coefficients for each of the five analog channels,                                                                       |
| BITS.XXXXXXXX,Title-up-to-23-chars  | The x's specify the state of the bits that match the BIT Labels.                                                                                    |
| T#sss,111,222,333,444,555,xxxxxxx   | This is the on-air format for the UI packet, where sss is the serial number followed by the five 3 digit analog values and the eight binary values. |

PARAMETER NAMES: Due to the 80 character screen width in DOS, each parameter has a fixed NAME/UNITS length. The lengths for the 5 analog channels are 7, 6, 5, 5 and 4 characters. The lengths for the 8 digital bits are 5, 4, 3, 3, 3, 2, 2, and 2 characters respectively. So you may need to decide early on what channel to use for what purpose based on the number of characters available in the display...

DEFAULTS TO APRS Mic-ENCODER: Since the predominant application of the MIM module is in the APRS Mic-Encoder, the default telemetry parameters and units for the Mic-E are normally displayed. These will go away if any on-air parameters or equations are received...

#### APPLICATIONS:

- 1) Balloon payloads using only party balloons (not big ones)

- 2) Tracking wildlife or packages
- 3) Small stand-alone trackers
- 4) Model Aircraft
- 5) Keeping track of your kids.

LOW POWER TELEMETRY TRANSMITTERS: To complement this less than ONE-CUBIC inch MIM telemetry system, Agrelo Engineering in NY makes a 1.5 x 0.5 x 0.25 inch 2 meter transmitter for \$99. It outputs 500 mW at 6 volts 140 ma and 120 mW at 3 volts 50 ma. A new 800 mw model is now out! See more cheap transmitters in the GPS.TXT file.

#### ORDERING YOUR MIM:

Order the MIM from APRS Engineering LLC, 115 Old Farm Ct, Glen Burnie MD, 21060

The MIC-E protocol is not defined sufficiently for a programmer to implement it, either on page 8 or on page 17. As the MIC-E protocol can be somewhat confusing, I would recommend adding a reference to it such as: <http://www.tapr.org/tapr/html/mic-e-proto.html>

Type of report: OMISSION:

Summary: Internet APRS protocol specification omitted

DATE: October 3, 1999

Submitted by: Jeff King wb8wka, jeff@aerodata.net

Detail of problem:

In the file Announcement2.pdf it states on Page 3, under the heading "Protocol Committee" in the first paragraph:

"The APRS Protocol Specification is the formal definition of the data elements and message formats used to communicate between APRS devices via wireless or wired (e.g., Internet) connections. It does not include user interface of other elements that do not affect the content or format of these interface components."

On Page 3, third paragraph it states:

"The Protocol Committee intends to publish Version 1.0 of the APRS Protocol Specification by the end of October 1999. The first draft of the Specification will be made available to the amateur community by the end of June 1999, and comment will be accepted as defined below"

Understand the slipped dates, however paragraph one and three clearly state the internet protocols (e.g.. APRSSERVE) are to be part of this document.

Hence, I am alerting you to there omission from the first draft.

Hi Guys --

There've been a couple of postings asking how we're going to handle comments on the protocol draft.

The automated mechanism for handling comments or request changes for the APRS protocol isn't developed yet. In the meantime, the aprsspec mailing list will have to do most of the work, with some help from me.

Here's what I intend to do, but I need to put a disclaimer out first. I'm going to be having surgery on Tuesday (Oct. 5) to remove a couple of blown-out disks in my neck, and have the associated vertebrae fused.

Doctor's orders are that for the first two to three weeks after the surgery, I'm to spend no more than 15 minutes at a time at the computer, and that only a couple of times per day (and work-related stuff has to come first). So for the next few weeks, don't expect to see much from me.

That said:

1. The public comment period for the draft 1.0 spec will continue until November 1, 1999. By November 7, 1999, the WG will publish an anticipated date for publication of the final document for APRS Protocol Specification Version 1.0.
2. Although the developers are already subscribed to the list and see all the messages, I will keep a separate archive of those messages for future reference.
3. To make my life easier, please begin the "Subject" line of any message that is intended to be a formal comment with "Comment:", "Error:", "Omission:" or something similar, so I can filter submissions from normal traffic.
4. I will maintain a simple database of submissions, including the submitter's name, date submitted, brief description, and disposition. The "disposition" will be based on the vote (or more likely consensus view) of the Working Group members, and will probably be something like "accepted", "accepted in part", "rejected", "deferred", or "further info requested" (but don't hold me to those precise terms). The disposition field may not be filled in until after the end of the comment period (in other words, not every submission is going to be acted upon immediately after it is sent, though some might be).
5. I will upload the submission database to the Working Group web page, and do my best to update it regularly. I will also post it, and updates, to the aprsspec mailing list. Given my situation, it's likely that nothing will be posted anywhere until the latter part of October. Sorry about that...

73,  
John N8UR  
APRS Working Group Administrative Chair  
jra@febo.com

Brent,

The information presented on this subject to date does nothing to clarify how the compression formatted message can be encoded and decoded.  
Can you provide more info?

Bill KC9XG

-----Original Message-----

From: Brent Hildebrand [SMTP:bhildebrand@earthlink.net]  
Sent: Sunday, October 03, 1999 5:06 PM  
To: APRS Spec Discussion List  
Subject: [aprsspec] Correction: Compressed format

Page 6:

The inclusion of compress format in the paragraph on packet types is confusing. Compressed format is part of one of the other packet types:

>From Page 6.

...!DDMM.hhN/DDDMM.hhW\$... Fixed format (digipeaters) no APRS  
=DDMM.hhN/DDDMM.hhW\$... Fixed but is APRS message capable  
/DDHHMMzDDMM.hhN/DDDMM.hhW\$... Stationary, time of last fix  
@DDHHMMzDDMM.hhN/DDDMM.hhW\$CSE/SPD/... Moving (with APRS)  
@DDHHMMzDDMM.hhN/DDDMM.hhW\CSE/SPD/BRG/NRQ/.... DF report  
[XXnnyy].... Grid Square  
[XXnn]... Grid Square  
/YYYYXXXX\$csT Compressed format which can be used

in place of LAT/LONG/cse/spd in all  
formats. /\$ are the ICON bytes and T  
is a TYPE byte. See YYYYNNNN.txt

This seems to imply that a compressed packet is /YYYYXXX\$csT. But it is  
really part of one of posits types.

Normal: =DDMM.mmN/DDMM.mmW\$PHGxxxx.... (also works for !)  
Comprssd: =/YYYYXXX\$csT...

Normal: @121234zDDHHMMzDDMM.mmN/DDMM.mmW\$CSE/SPD...  
Comprssd: @121234z/YYYYXXX\$csT... (also works for /)

Brent Hildebrand, KH2Z

Bill:

The reason you and Brett are having such trouble with this, is the document describing the compressed format is missing. This would be the yyyxxxxx.txt document that is referenced, also referred to as the compressed format.

I've never seen it on any official APRS site or on the TAPR site. I have however seen in on the ARPP file list area. See:

[http://www.onelist.com/files/arpp/rough\\_APRS\\_protocol/compressed\\_format.txt](http://www.onelist.com/files/arpp/rough_APRS_protocol/compressed_format.txt)

Note I have no idea if this is it..... this should still be treated as an omission until someone from the WG provides the file as they are the only definitive source.

I think I'm ready to go back to the "PACKET" name. I changed it to POSITION when GPS became so popular, but it really was "PACKET" in the early days.

So I say YES. PACKET.

APRS was designed for tactical-real-time support for emergency and special event operations... ususally local. The fact that we use it 99.9% of the time for wide area general ham radio, 24 hours a day is just its "standby" mode to keep us all trained and familiar with its operation.

During the protocol discussions to follow, I hope we dont lose sight of the fundamental local/real-time urgent (but very rare) design objectives.

We frequently use paths of 4 hops or more just to make sure there is enough activity in most areas to make APRS interesting most of the time. But as emergencies and special events occur, the first thing to do, is cut back to the area of need. APRS can support about 100 users. During benign conditions, this may take one or two states to see that many users. But during an emergency or local event, as more and more stations participate, then the paths will have to be shorter to avoid overload...

Pardon my ignorance if this is addressed already.... not meant to  
flame or place any other comments in a poor light...

Given emergencies aren't likely to make an effort to impact only one  
time zone... and given this is something the military has had extensive  
experience in.... I suggest that APRS either adhere to ZULU... or if  
local time is a necessity... that a field be defined with a single character  
that refers to the local time zone...

Confusion will reign if either we aren't all on the same time standard..  
or that we don't explicitly state our time reference... history proves  
this over and over and over...

Given that this is amateur radio, not the military, I believe that the term "UTC" would be more appropriate for the specification. See, for example, "The ARRL Operating Manual."

I agree with Allan's general sentiment that UTC be used unless local is a necessity. Being close to the boundary between Central and Eastern time, I see far too much confusion possible unless "local" is properly defined.

Since, as I understand it, this document is currently defining the APRS protocol as it exists in current implementations, establishing a way of designating the local time zone needs to be deferred until post V1.0. That being said, I don't think a single character is the way to go. After all, we have a well-defined standard for time zone abbreviations which covers the world; that should be used or "confusion will reign" even more. There are already far too many "special cases" in this protocol spec, IMHO.

On a related point, the second line starting with "@" on page 6 ("@280817/3610.19N/08414.99W-ccc/sss") is missing the time zone character, and should start either "@280817Z" or "@280817/" to be correct.

I believe that the \_protocol\_ should use UTC and that the use of  
or translation to local time should be left to the user interface.

I also believe that the protocol specification should indicate that  
UTC is preferred, and that the use of local time \_in the protocol\_ is  
deprecated, (specification language for: "we did this in the past, but  
we figured out that it is a bad idea; you should be able to receive  
it, but you shouldn't transmit it").

Sorry, I may have confused things. The authors have all agreed that only ZULU will be used on the air. All current versions adhere to that standard.

But local display in local time is an option. So I guess you are correct, that there is no need for a "format" for local time... since we will not transmit it on the air that way...

The MIC-E protocol is not defined sufficiently for a programmer to implement it, either on page 8 or on page 17. As the MIC-E protocol can be somewhat confusing, I would recommend adding a reference to it such as: <http://www.tapr.org/tapr/html/mic-e-proto.html>

John:

I'm sorry to hear about your pending surgery.

> In the meantime, the aprsspec  
> mailing list will have to do most of the work, with some help from me.

Maybe it is time to ask the other members of the  
WG to participate publicly, especially in light of your limited access  
in the coming weeks. It just seems like only you and Greg have spoken  
up so far on APRSSIG.

> 3. To make my life easier, please begin the "Subject" line of any  
> message that is intended to be a formal comment with "Comment:",  
> "Error:", "Omission:" or something similar, so I can filter submissions  
> from normal traffic.

Please add one more, called "Clarification:". These types are questions  
that would need to be answered before the close of the comment  
period. See my posting I just made:

Clarification needs to be made as  
to the target audience of this document.... is it:

1. Written for a programmer who is does not know APRS (which I hope is the intent).
2. Written for someone who has been exposed to it for some period of time and will have help from a APRS insider or can dig around enough on there own (reverse engineer) to figure things out (the omission of MIC-E, MIM telemetry, internet and compressed formats current puts it in this category)

In reviewing any kind of document, it is important to know ones target audience.

Thanks John and I hope your surgery goes well.

-Jeff

Thanks; it's not a huge deal, but it sure is annoying.

I'm not sure that's necessary, other than perhaps to discuss the point  
you make below. My role is to be the coordinator and facilitator; the  
authors are certainly encouraged to carry on discussions about the spec  
without me.

Understand your point. I wasn't trying to be exhaustive in the list; I was just trying to get a mechanism so I can quickly separate submissions from other traffic.

I can't answer this for the group; we never discussed it in quite this context in our meetings. But speaking for myself, I hope that the final protocol document is closer to your first option than the second.

I think, however, that in practice -- as with most protocols -- the document will only be able to take you so far, and looking at real-world implementations will fill in some details.

As to the omissions you cite, I don't think those are intentional but are the consequence of a first draft effort.

John

One clarification of the multiple TAC call message, if the first field does not contain an "=", then it is assumed to be the tactical call for the sending station. Example:

```
KH2Z>APS200,WIDE3-3::TACTICAL :Brent;WU2Z=Keith;WB4APR=Bob{0
```

Meaning:

KH2Z is Brent

WU2Z is Keith

WB4APR=Bob

Of course, the following is also valid and does the same thing:

```
KH2Z>APS200,WIDE3-3::TACTICAL :KH2Z=Brent;WU2Z=Keith;WB4APR=Bob{1
```

The prior construct is only in the most recent versions of APRS+SA. If you'd prefer to keep it simple, then maybe the following two constructs should be used:

For settings one own tactical callsign:

```
KH2Z>APS200,WIDE3-3::TACTICAL :Brent{2
```

For setting multiple tactical callsigns in one message:

```
KH2Z>APS200,WIDE3-3::TACTICAL :KH2Z=Brent;WU2Z=Keith;WB4APR=Bob{3
```

Also note, the way I implemented the transmission of tactical callsigns, is that they have line numbers, but are transmitted only once. They of course

can be retransmitted by APRS+SA by a right-click on the message, and choosing transmit. Line numbers are not probably needed, and APRS+SA ignores them on reception any ways, since stations such an APRSdos station might transmit their tactical callsign, and would have a line number. Messages to TACTICAL should never receive an ACK because there should not be a station called TACTICAL.

Brent KH2Z

Brent

I would like to get a copy of how you do the tactical call signs via APRS messages.

This is one of the things that is not in the current spec that is missing.

>So I say YES. PACKET.

Ohmygosh, Bob! Don't do that! LEAVE IT WHERE IT IS!

One of the prime directives of marketing is to decide on an "image" and stick with it. All the press in the past two years has been with "position", and "position" is self-explanatory. In so many words, "Automatic Position Reporting System" works - it instantly describes the core capability of the system to the uninitiated... and even non-hams. To change it back to the nebulous buzzword "packet" will be highly counterproductive.

I do realize that "APRS" belongs to you, but - please - don't make more work for everybody by changing the meaning of the acronym back to something meaningless outside of the fraternity.

...mike/N0QBF

You're absolutely right Mike! But we have to look to the future, not drag our heels in the past. APRS *\*used\_to\_be\** a *\*position\** reporting system, but it isn't any more. As we all know, it's very much more than that now.

You tell people today that it's a *\*position\** reporting system .... yawn, ho-hum, is that all? After all, you can buy GPS-enabled map packages off-the-shelf in the local computer store for a few dollars ....

Tell them instead about all of APRS's many capabilities, which, by the way, happen to include position reporting, *\*then\** you'll awaken interest.

As I said before, to just call it a *\*position\** system is IMHO doing APRS a great injustice. Now is the time and the opportunity to project it as something much more capable.

In a nutshell, APRS has changed a great deal since it first appeared. It's time we changed the name to reflect this -- even Bob agrees. To leave it *\*unchanged\** is the retrograde step.

The way to market APRS now is to tell the world that its name *\*has\** changed. This will excite curiosity, it's something new, it's something much better than before! Remember, a lot of people probably didn't run with APRS in the old days because it was expensive, you could only report positions on crude maps, and it only worked on DOS/Windows/Mac.

Now you can attract them with a zillion features/benefits, it costs a lot less (the most popular version here in the UK costs only US\$16 to register), and it works on handhelds and Linux as well.

What do others think?

Hi All!

I can't understand where you might think that real time position plotting of information is ho-hum, but alluding to an outdated, slow and sometimes cumbersome method of transporting that same information is new and exciting. Just what is so exciting about ax25 packet, especially at 1200 baud?

We all know that APRS is used to convey much more than simple position information, yet, the bottom line is that the vast majority of users will have a map with icons on it to look at.

In fact, from what I remember, the name already included packet at one point, and was changed to denote position when GPS was introduced. What's the marketing strategy in trying to change it back again? Why confuse things?

Might I suggest if we want to change the name we should change it to ADRS i.e.: Automatic Data Reporting System, or some such generic nomenclature.

I'm not necessarily advocating a name change. I think anyone who cares already knows, and anyone who might care MAY be turned off with the "Packet" in the name. What happens when we stop using ax25 packet to deliver the information? Another name change?

I hope not.

Besides, I already bought the T-shirt! (grin)

It can pass through a voice grade radio (e.g. "Data over Voice")

Also, an AVL protocol can be made very compact.... 6-8 bytes. When you consider TXD times, the difference between 9600bps and 1200bps, with regards to the data frame, is insignificant.

For pure AVL, its just not that bad.

-Jeff

btw, this is off topic (sorry)

Your comments were quite good, although somewhat more 'picky' than I  
had expected, the clarifications you suggested where all good...

I will include them in the next revision.

You asked one question that I want to answer now..

At 3:05 -0400 10/3/99, Darrell Hale wrote:

>

We don't care HOW it is done, we are suggesting that the software keep track of the call sign that TRANSMITTED the object. This came up when multiple stations were transmitting Hurricane objects, some were doing it correctly and some were sending bad data (entered manually). Some of the earlier versions had no way of knowing WHO transmitted WHICH object after the actual packet that caused the object to appear got flushed out of the buffers.

The only place (that I know of) that LOCAL time is currently used is in the NWS county alarms, and this is because the announcements on the radio are given as:

"The National Weather Service has issued a severe storm warning for the following counties, xxx xxx xxx xxx. This warning is in effect until 11:00pm this evening."

This time is always given in local time.

The APPxxx for the Mike Music's version was left out by accident..  
(Sorry Mike)

I don't remember if APRS-Max has its own ID or not, Bob can clarify that.

As for the XASTIR, he has not been assigned anything yet, nor has he asked for one that I know of... (Bob?)

APXxxx is for the Sproul's X-APRS..

And since the Server is currently down, I can't easily go find out if he is actually using anything specific at the moment...

Thanks for the clarifications..

This is the type of stuff that I was hoping to get on this list....

I believe that in general information should be included in the APRS  
protocol specification, rather than merely referenced

- o Including the information in the APRS protocol specification  
ensures that it is reviewed for correctness and corrected if it  
is incomplete or incorrect.
- o Most of the documents that are likely to be referred by the  
protocol specification were not written as protocol specifications.  
As such, they are likely to contain extraneous information (e.g.,  
information about how a particular implementation works,  
information about how to use a particular implementation, or  
descriptions about how certain protocol constructs are displayed)  
and are unlikely to be rigorous, (e.g., using terms such as "must"  
and "should" appropriately).

I agree with you, and will be doing that, just until we get it all  
done, the references are better than nothing.

The one exception to this is the NMEA spec, that is copyrighted by a  
different organization, and we will reference that.

Frank:

Please see the attached. It was pointed out on the APRSSPEC list that your APRS display program "XASTIR" had not been assigned a version specific designator. The comment was made by a A:PRS-WG member that he was not aware of you asking for one.

As I don't know if your on the list, or if anyone else contracted you, I thought you might want to opportunity to request a designator, if you needed one. Please ignore this message if your already aware of this discrepancy.

Regards,

Jeff

Why is the version of the transmitting station contained in the AX.25 Source Address?

I believe that consideration should be given to marking this protocol feature as "deprecated", (i.e., APRS receivers should accept packets with software version identification in the AX.25 Source Address, but APRS senders ought not put software version identification in the AX.25 Source Address).

Are there any cases where the receiving software operates differently based on the software version identification contained in a received APRS packet? If the answer is "Yes", then I have some concern about the protocol and its specification. If the answer is "No", then it sounds like the feature could be deprecated without difficulty.

I have three specific concerns about this feature:

- o This feature has the appearances of a backdoor method of controlling APRS implementations. All we know is that new software identifiers must be approved by the current [authorized] implementors. Whatever the actual facts, this presents the appearances of potential conflict.
- o Presumably, we will see lots of new APRS implementations in the future. I think we ought to have a really good reason to keep revising the protocol specification as new implementations are created, (or worse, not updating the specification).
- o This section has the appearance of being intimately tied with Bob's licensing and consulting activities. This seems to offer the potential for future misunderstandings.

Jeff, Keith, APRS-WG members, and WG-SIG,

Jeff, Thanks.. and I did get this..

As to this issue, I don't think this should be a "BIG" issue.. as I just received a new message (from the sig as he states "The letter 'Z' is reserved for 'EXPERIMENTAL', which is correct."). I don't think that this may be the proper discussion for this sig, but I did want to clear out any further discussion. As I am not it the "regular" group of APRS developers, I didn't even think ask for any special designator. If the members of the group want to add this that is fine with me, but it is not as important as a standard written protocol. I would point out that this is a transition, things will take time, don't waste time on the small details. I would rather have it all play nice together.

Keith,  
Thanks for the clarification.

73,  
Frank

Wrong on all counts. The intent is to identify the code source and version of a packet for troubleshooting. With everyone and his brother now in the game, this is even more important than ever.

All,

I copied this off the AMSAT BB. I think APRSdos assumes feet too.  
I will correct this in my next version to check for "units" in the  
altitude field... bob

-----  
On a much less critical note:

A few balloon launches back we noticed that the balloon GPS data  
said the payload was at 20,000 feet an hour after launch. It was  
SUPPOSED to be at 60K+ feet.

You guessed it. The GPS was putting out altitude in meters,  
and the ground software wasn't doing the conversion. Fortunately  
the simple analog temperature sensor told the true story, although  
less accurate (temp to altitude conversion). We finally figured  
out that things were working. We just weren't translating.

We got off much cheaper than NASA...

I made a suggestion to the APRS authors a few weeks ago, and perhaps this is the forum to mention again.

If we are to gain any credibility with any official agency (ie the NWS), we need a way to control objects better.

1) We need a 2nd level of objects that can ONLY be created and modified by "official" stations, such as SKYWARN stations. General users should be

able to create objects as usual and move them around.

2) There should be a method for turning off all "non official" objects on YOUR screen. Any object you create will be visible regardless of the state of this QRM filter.

Using this method, we can publish "official" storm positions, and not have to see ALL of the other erroneous positions / misspelled storms. We can prevent unofficial stations from grabbing an official object and moving it for us. All that we need to do is alter the symbol that begins the object. Presently it is a semicolon. I'm not sure which ASCII character we'd choose to use, and it doesn't matter... just as long as "unofficial" stations continue to create semicolon objects, and are not permitted to create "official other yet to be decided ascii characters" messages.

Hope this makes sense!

Wes

Hi, all...

I agree with Keith in that the verbal "in effect to" time is local. As such it is directed to those close enough to the issuing office who are (usually) in the same time zone.

The encoded data header for NWS WX (including counties and zones) ends with ZULU/UTC although not normally indicated with the Z indicator. These releases can be captured by distant users in other time zones, via the internet, world-wide.

Having a transmitted time or day/time with Z (or U as an optional value for the purists) as the trailing character could be considered for incorporation into the Specification. Packet operators world-wide have long understood the usage of the Z indicator in time specification.

I support the concept of having Local time as a display only value which would be a local option with the user.

Thanks for the use of the soapbox.

I completely agree, Z is the only way to always know.  
I live in E indiana where we do not mess with our clocks twice a year.  
If it's not Z, then there's a mess of interpreting to do, based on where the  
sending station is.. :-P

Now if we used swatch beats.... (oonly kidding!)

What you are saying is a good idea. It would be a layering of the stations. This is done a great deal in network drawings and maps, which APRS is a network/map drawing. One layer is the map, the next layer would be the "Official" objects, and a third layer could be the general users. But this adds a level of complexity, maybe not to the APRS spec, but how the APRS software would be written. There would have to be an additional identifier added of some type to designate what type of station it is, official vs. general.

Just my thoughts.

Scott

Wes,

Although I completely agree with what you are proposing, it might not be a protocol issue. It might just be a software issue on the users end. One example could be to have a list of 'known good originating stations' that software says ONLY SHOW OBJECTS IF THEY CAME FROM ONE OF THESE STATIONS..

This is one of the reasons we have 'magic secret decoder ring' for the issuing of NWS county alerts.. The NWS specifically asked us to limit the creation of these alerts.

I agree that we have to cut down on the bad reports.. The MAIN way should be via education...

As for the storms etc, the stuff that Dale Hugely is doing to automatically create this will (hopefully) reduce the number of people putting up the erroneous ones..

Keith

Dale is publishing these objects... but for example when Hurricane Floyd came thru, I literally waited for 8 or 10 hours to get Floyd on my screen at all... I realize that he is publishing this data when it is given to him, but we need to think about the "net cycle" time of 30 mins... and include such objects in there. Otherwise, someone will take it upon themselves to create Floyd. If Floyd already exists, they wouldn't feel the need.

Another issue is malicious use of an object. We need to be able to create an object that no one but an official user can move. That way Mr. Average Joe won't click on the hurricane with his ALT button pressed and drag it around (not realizing that he's moving it on EVERYONE's screens.). When I showed APRS off for the Georgetown SC EOC a few years ago, that was one of their concerns.. I said aprs was an open system... they said "We don't want anyone controlling our objects".

I perused the 22 messages in the Web page "Visit" before I signed up. Then I bounced a message, found out two days later. I hope the following discourse is not redundant. Apologies if it is....

On page 8, in the Weather Report section, reference is made to WX.TXT, but it is not available at the APRS spec. web page. Obviously, all referenced files should be included on the web page for review.

{NOTE: I should have read WX.TXT before typing the following, but this comes from a reading of the protocol spec itself:}

Also, in the wx example given:

(I quote)

@DDHHMM/DDMM.hhN/DDMM.hhW\_CSE/SPDgXXXtXXXrXXXpXXXPXXXhXXbXXXXXdU2k

r is in hundredths of an inch of rain in the LAST HOUR

p is in hundredths of an inch of rain in the LAST 24 HOURS

P is in hundredths of an inch of rain since midnight

s is INCHES of snow in the last 24 hours

b is in tenths of millibars

h is percent humidity (00=100%)

dU2k is Ultimeater 2000,

U5 is the 500,

Dvs is Davis

RSW is Radio Shack

PIC is a PIC device (K4HG?)

HKT is Heathkit

The first character designates what version of APRS

'd' = APRSdos

'W' = WinAPRS

'M' = MacAPRS

'X' = X-APRS (Linux)

'S' = APRS+SA

Lxxx is luminosity in Watts per square meter 999 and below

lxxx is luminosity in Watts per square meter 1000 and above

L is inserted in place of one of the rain values.

(end of quote)

... no reference is made to the gXXX and tXXX; I assume these are gust speed (what basis? peak, 1 min. avg., other? what units, for that matter?) and temperature (whole degrees F, I assume... signed? where does the "-" go? how to represent -100 degf?)

In the "dU2K", is the "d" the DOS designator, so that WU2K would be the U2000 reported by WinAPRS? Then other examples would be dU5, MDvs, etc...

Also, what is the usage of "luminosity"?

I'm guessing all these are answered in WX.TXT....

Also, I'm assuming, but it's not stated explicitly, that the letter (g, t, l, etc.) comes BEFORE the digits of the corresponding value. (Again, WX.TXT) Are all values are fixed width or some variable?

Yes, I know, I'll go back and read my copy of WX.TXT from my APRS docs.

The position examples use N and W; I assume S and E are valid. Which letter

is used for positions of 00.0000 latitude and 000.0000 and 180.0000 longitude? Even if they "never" appear, it is possible to navigate there, so it should be stated in the spec. Is either letter allowable (00.0000N = 00.0000S)?

The protocol seems to have, but it is not explicitly stated so anywhere, various "sections", like a position section, a comments section, etc., so that any "position" format could be substituted in the appropriate part of the packet. Is this so? To what extent? Could a WX report be sent with a Pos in GRID-in-TO format? An object sent with a MIC-E compressed pos? Please be VERY clear on the allowable combinations of these "parts" -- position, weather, telemetry, comments, messages / bulletins / announcements, mail, any others. Altitude? Or is that only in the appropriate GPS format (GPRMC, I think...)? Also, there is no reference to or discussion of NTS traffic handling. Is there a specific sequence of messages used for the message number, originating station, check, place of origin, time/date, addressee, message and signature?

Basically, are we documenting only what is currently being sent over the air, or are we documenting what is acceptable to at least some version (DOS, Mac, Win, X, Xastir, +, Palm), whether it actually occurs on the air or not, but is still part of the "current protocol"?

73 and MANY thanks for the effort to date! (After all, this is a HOBBY!) And thanks for listening to my diatribe. (Go, Tribe!)

Dale, W8ABZ  
Cleveland Hts., OH

Hi, all....

On a side issue (NWS WX counties) some document, somewhere, might include the concept of prioritizing the NWS warning/watch/advisory/etc so that the highest priority would be displayed (the on-top layer concept) until it reached expiration. Then automatically replace that higher priority item with the next highest, ad infinitum, until there were no more WX items to be displayed for that location. I am not aware that we have any APRS software that will permit that to occur.... yet. TNX for the use of the soapbox!

Something I have thought of/seen, of course related to the hurricane problem, is (potentially unknowing) use of duplicate object names. For example, somewhere in the midwest someone sends a HAMFEST object. A day later, someone else, different city, maybe unaware of the other object, sends a HAMFEST object for their city, removing the other valid object. They maybe should have used HAMFEST2 or whatever.

I don't know if it would be practical to have some sort of error-trapping built in the software to say "there is another object with this name, are you sure you want to send this object, YES or RENAME your object", etc., since we are on a national scale not just local even with local RF objects.

Another 0.02 .

I occurs to me that "Local Time" could be designated with a single character  
for the time zone- there is something like that already in the database I

use to generate NWS maps. My problem with "Local time" is that if you are outside of the "Local Area" you have to know the sending station's position. to decipher the time. If your time zone is different than the "local time" you will never see a lot of the NWS warnings. If you are in Yuma Arizona and issue NWS warnings for the Yuma/Imperial area you have a devil of a time deciding which time zone to use.

Keith Sproul and I had talked about a first character designator for "Automatically Parsed Data" to take care of some of the problems with Hurricanes, Tornados etc. Presently there is a "." (period) for Space Weather which could be redefined as "Automatic". The various authors will have to see if this is feasible. I think the Space Weather will probably end up being sent as normal messages.

It's worse than that, the edges of time zones aren't straight.

Oh... (although appearances are important in this matter).

I don't find the software version of the sending station a particularly

useful protocol construct, but I suspect that this reflects differences in protocol implementation philosophies. I think some examples of how you have used this field would be enlightening.

I started crafting a much longer reply, but my short answer is that I believe that it is the responsibility of the receiver to process any malformed packet without blowing up. I believe that this is the only approach that will work in the evolving APRS environment, particularly given:

- o the move to an open APRS development community where presumably many new, uncoordinated APRS implementation will emerge, and
- o the emphasis placed on APRS as emergency communications tool.

Among other effects, this receiver-validates-all-packets approach removes the need to quickly find the originator of malformed packets. Rather, the immediate response to software blowing up in response to received packets is to release a corrected version of the receiving software that silently ignores the malformed packet, rather than blowing up. Therefore, knowledge of the sending software version is a less pressing need.

I recognize that you are developing in a environment with only a limited amount of memory, that you like to add new features, and that you have chosen a monolithic software model (one program does everything). I also realize that at times these objectives conflict with the inclusion of extensive error checking of received packets. I guess I don't have much of a recommendation beyond observing that I believe that extensive validation of received packets is the only approach that scales into the future.

It would probably also be useful if I got around to sending e-mail about the lessons learned about ensuring interoperability and robustness in the Internet, (since I think these are the issues you are trying to address with the sender software version identification.)

By the way, what would be really useful is to include the APRS protocol version number in the packet. But, that too is the topic for another e-mail message.

I believe that the most appropriate technology to address this need is  
cryptographic authentication. That is, the originator might  
cryptographically "sign" an APRS message. The receiver could then,  
if and when desired, verify the signature on the message in order to  
verify the identity of the sender.

This sounds like a good master's thesis for someone...

This would introduce a module of "secret code" that would really interfere with portability. I'm having trouble imagining a cryptographic approach that would allow open source on the algorithm, and knowlege of what's being encoded, and still be secure.

I recommend a solution based on public key cryptography and digital signatures. The algorithms are public, and I believe that quite a bit of code is available for the algorithms. The missing piece is the public key of the entity signing the messages. This could be received from a trusted online source, such as an APRSServe (but, you might want to authenticate the identity of the APRSServe...) or a set of public keys could be distributed with APRS software or via the Web.

One source of info about public key cryptography is the RSA FAQ:

<http://www.rsasecurity.com/rsalabs/faq/>

Note that some languages include support for these services:

<http://www.java.sun.com/products/jce/index.html>

This is a complicated area, but the science needs to be understood by only a very small number of APRS developers (one might be enough). There are lots of issues, such as selecting the appropriate algorithm, designing a key distribution mechanism, and avoiding the Export Control Act,

(cryptography is a munition). Given a design, most developers should be able to implement the functionality.

This feature would probably be optional. Some implementations may choose to not implement digital signatures and therefore implicitly assume that all messages originate from valid sources.

This is a "big computer" job. I admit my bias here, I'd like to stay with what can reasonably be achieved in a microcontroller. All we NEED here is authentication, not encryption. It's a crime to use someone else's callsign, so I think we already have the needed mechanism. If someone starts bootlegging calls and screwing around with objects, then folks like me need to start hunting his ass. (DF gear on standby 24/7)

Gosh. A ring on my finger can do this  
(<http://www.ibutton.com/ibuttons/index.html>). So can a card in my wallet  
(<http://java.sun.com/products/javacard/index.html>)

> All we NEED here is authentication, not encryption.

I am suggesting authentication based on cryptography, not encryption.  
The APRS message would still be in clear text; it would merely have  
some junk (a digital signature) appended to the end.

But we will also be busy doing OTHER things, like APRS.

I get the difference, and I wasn't thinking you meant encrypted packets.  
The "junk" still has to be generated for each packet.  
If the "junk" is the same on each packet, then joe nasty can just copy my  
"junk".  
Still, all we need is to authenticate the sender.

> particularly given:

Being a recent addition to the fold of "APRS Developers", I can assure you that it's every author's intent to parse what packets they can, and discard the rest without any undue explosions. There is quite a bit of code in APRS/CE that does range-checking and other "sanity" checks on values within packets before handing them off for further processing.

I think the "version-in-the-TOCALL" concept does two things:

(1) If you happen to find a malformed packet (whether or not it blows up a given receiving station is a totally separate matter), it allows you to determine the platform and version of the software that is sending said packet. Who cares? The author, for sure! If someone gets a bogus packet with a TOCALL of APC101, they can send me an e-mail and a copy of the packet. Then I have a record and can start tracking it down if I am not aware of the problem already. If we all used a generic TOCALL of "APRS", or something like it, then the operator of the station has to be contacted and queried about what version of APRS they're using, on what platform, etc.

(2) It allows the receiver to know what the capabilities of the sending station are. Does the station have messaging capability? Will it understand this packet I'm about to send with a protocol change in it? Does it have a small screen, so I may want to break this message up into shorter segments? (Especially true with the D7, which sends messages and ACKs to APK001 by default. Win- & MacAPRS take advantage of this, breaking a

message up into much shorter lines when sending to a D7.)

I think these types of things drove the design of the protocol, not a desire to have absolute control over who writes what software.

Oh... (although appearances are important in this matter).

I don't find the software version of the sending station a particularly useful protocol construct, but I suspect that this reflects differences in protocol implementation philosophies. I think some examples of how you have used this field would be enlightening.

I started crafting a much longer reply, but my short answer is that I believe that it is the responsibility of the receiver to process any malformed packet without blowing up. I believe that this is the only approach that will work in the evolving APRS environment, particularly given:

Here's the nickel tour of public cryptography.

The NWS generates two keys that are mathematically related. Anything encrypted with one key can ONLY be decrypted by the other key (and vice versa). Due to the algorithm it's almost impossible to determine one key from the other (with out spending thousands of years of computer time).

The NWS keeps one key private and publishes the other. This published key is incorporated into the APRS programs.

When the NWS sends a warning via APRS, They pass the message through another function called a cryptographic hash. This generates a hash code which is similar to checksum, but due to the algorithm used can be guaranteed to be unique to the message.

They then encrypt the hash code with the private key, append it to the message and send it out to APRS.

The receiving program, if it wants to confirm the message, decrypts the hash code using the published key.

(Confirming that it is from the NWS because it could only have been encrypted with their private key). Runs the message through the same hash

function and compares this hash code to the decrypted one. If they match, The program knows 1) The message definitely came from the NWS, and 2) it was not altered in anyway.

A program that didn't care about confirming could just ignore the encrypted hash code.

Is the intent that ONLY NWS be able to use this? That does simplify things  
a little.

For ex, I would never have to generate this mess, only untangle it.

> The receiving program, if it wants to confirm the message, decrypts the  
hash  
> code using the published key.

And this takes how long in an 8 bit machine, and how much ram?

Could this not be solved by using a mechanism like the registration key in  
WAPRS?

Just prevent packets "from NWS" from being sent unless the software is  
unlocked.

I can incorporate that as well in a microcontroller based device, in that I  
can disallow that field to equal a particular string, unless I (the author)

know the user is valid, and I provide him an unlock code keyed to his callsign. Now there is no global dependency on a particular encryption mechanism. The unlock code won't work for anyone else unless they want to pirate someone's call, which is of course illegal, and I think we'd see some enforcement action from the FCC.

What I'm asking for is some consideration of platforms that don't have "put in another 32meg of ram" as an option. I know it's easy to solve the problem in big machines, but that leaves little machines out in the cold.

> A program that didn't care about confirming could just ignore the encrypted  
> hash code.

Given.

Look at rolling codes as used in RKE devices. MicroChip has a line of parts that can do this and some ap notes on the subject. These signatures can be sent in the open as they are different on every transmission.

-Jeff

Gang,

Re: the APRS protocol documentation 1.0 Draft

Well, actually, I was really hoping for a BNF diagram of the APRS protocol. I'm willing to write it.

Backus-Naur Form is a formal meta-language commonly used to diagram all possible constructs in a programming language, command language, or a protocol.

A portion of the BNF for APRS might look something like this (this is just off the top of my head...)

```
<APRS-packet> ::= <Packet-path> ":" <Data-part> <EndOfLine>
<Packet-path> ::= <From-Call> ">" <To-Call> [ <Digilist> ]
<Digilist>      ::= [ "," <Digipeater> ] <Digilist>
<To-Call>       ::= "APRS" | "AP" <APIIdentifier> <Version> | "GPS"
<Data-part>     ::= <GridSquare> | <WeatherData> | <GPSSString>
<GPSSString>    ::= <GPRMCString> | <GPGGAStrng> | <GPGLLString>
<GPGLLString>   ::= "$GPGLL" "," <Latitude> "," <NorthSouth> ","
                    <Longitude> "," <EastWest> "," <Checksum>
```

and so on...

where "x" is the presence of the thing x,  
"[ something ]" indicates an optional occurrence of  
the thing /something/ and "this | that" indicates the presence  
of either the thing /this/ or the presence of the thing /that/.

Obviously the real BNF for the APRS protocol will be somewhat longer and contain many more fields, but this should give you a feel for the notation and hopefully why I think it is important to have something like a BNF diagram for the whole protocol.

If I was an APRS developer and I had to write a parser for APRS packets I'd *really* want to have a BNF diagram to follow. This ensures that you know all the possibilities of which "things" can occur and in what different order(s) they are allowed. It guides everyone so that they're all following the exact same "language" and provides some structure for your source code to follow. It also lets you easily construct a set of test cases to cover the whole protocol as documented. You can use the BNF to immediately determine whether or not a particular packet is conforming to the specs. It's much more formal and much less ambiguous than just saying

that the following are some valid examples.

This will be much more important if we suddenly have many new APRS authors.

I think a BNF for the APRS protocol would be a very good thing to have.

I'm willing to write up the BNF for the APRS protocol.

Just my \$0.02,

Douglas KA2UPW

Thanks for reminding me, Doug...

As I recall, the rules for the Packet BBS programs were also defined in BNF-like format. A very good suggestion for the protocol description. I hope the Working Group will agree.

TNX and 73 de Art

<x-html><!x-stuff-for-pete base="" src="" id="0"><html>  
Guys... all we need is a 2nd "type" of object.... one that all  
APRS versions will recognize as an object and that ONLY skywarn  
authorized copies of APRS can create....&nbsp; from page 9 in THE  
book....<br>  
<br>  
<font face="Helvetica, Helvetica">OBJECT\_\_\*DDHHMMzDDMM.hhN/DDDMM.hhW\$CSE/SPD/  
comments...<br>  
</font>This is what a standard everyday object looks like... Now if we  
change the semicolon in the front to an asterix..<br>  
<font face="Helvetica, Helvetica">\*OBJECT\_\_\*DDHHMMzDDMM.hhN/DDDMM.hhW\$CSE/SPD/  
comments...<br>  
</font>Now we have an "official" object.&nbsp; BTW, I chose the  
asterix because as far as I know, it's not used in any aprs  
packets.&nbsp; If i'm wrong and it is already used, please select another  
symbol...<br>  
<br>  
We could get mired down in public / private keys and all sorts of  
authorizations... but we already have a system in place... the  
&quot;secret decoder ring&quot; of skywarn.&nbsp; Let's just add a new  
category of object to the list of things that skywarn can do that normal  
users can't.&nbsp; When you get right down to it, a hacker could create a  
skywarn county warning by hand.&nbsp; So what we have is a case where a  
person could easily study our system and hack it.&nbsp; Most newbies that

would create an object don't read the manual, and once they do and understand, they are less apt to cause problems anyway.&nbsp; I just want to make it inconvenient for newbies to make objects... and to allow me to weed out those objects.<br>

<br>

Maybe we need a BUDLIST option for objects.... Don't show any objects from station K9PUP or only show objects from k4sky.... i dunno..<br>

<br>

&gt; Date: Wed, 6 Oct 1999 12:09:34 -0500<br>

&gt; <br>

&gt; &gt; I recommend a solution based on public key cryptography and digital<br>

&gt; &gt; signatures.&nbsp; The algorithms are public, and I believe that quite a bit<br>

&gt; &gt; of code is available for the algorithms.&nbsp; The missing piece is the<br>

&gt; &gt; public key of the entity signing the messages.&nbsp; This could be received<br>

&gt; &gt; from a trusted online source, such as an APRServe (but, you might want<br>

&gt; &gt; to authenticate the identity of the APRServe...) or a set of public<br>

&gt; &gt; keys could be distributed with APRS software or via the Web.<br>

&gt; <br>

&gt; This is a &quot;big computer&quot; job.&nbsp; I admit my bias here, I'd like to stay with<br>

&gt; what can reasonably be achieved in a microcontroller.<br>

<br>

Gosh.&nbsp; A ring on my finger can do this<br>

(<a href="http://www.ibutton.com/ibuttons/index.html).%A0"

eudora="autourl">http://www.ibutton.com/ibuttons/index.html).

</a> So can a card in my wallet<br>

(<a href="http://java.sun.com/products/javacard/index.html"

eudora="autourl">http://java.sun.com/products/javacard/index.html</a><br>

<br>

&gt; All we NEED here is authentication, not encryption.<br>

<br>

I am suggesting authentication based on cryptography, not encryption.<br>

The APRS message would still be in clear text; it would merely have<br>  
some junk (a digital signature) appended to the end.<br>

Actually what would be even better is the blcok diagram that you see other  
network protocols formatted in, Take a look at some network protocol books,  
that use a line diagram (blocks end to end) with the length, what the  
bits/bytes are for, etc.

For the moment, the protocol will NOT be in BNF!!!

I thought the idea was to make a document that the 'AVERAGE' person could read it, not just people with a degree in Computer Science.

I agree with the block formats for some stuff, but instead of being PICKY, lets make sure it gets COMPLETE.. and is CLEAR (no ambiguities)

The comments about stuff that was either missing, incomplete or unclear have been very good, and I will be implementing them into a new version in the near future. (End of October or earlier, I hope).

I -WAS- happy with the way stuff was going on on this SIG, but I don't want to be 'picked' to death just because one person wants to see it done THEIR way and somebody else wants it done differently.

It is going to be a reasonable amount of work going thru all of the email and making sure I have EVERY update/change etc included. I already have approaching 100 messages about the SPEC..

Some people have been making suggestions about NEW stuff, this is all fine and good, but it will slow the process down. If you want to make suggestions/comments about new things, please either wait, OR put  
NEW SUGGESTION in the subject so it can be put off to the side until we get the CURRENT stuff fully documented.

You may wish to look at Augmented BNF (RFC 2234, "Augmented BNF for Syntax Specifications: ABNF, <ftp://ftp.isi.edu/in-notes/rfc2234.txt>).

You may find that the sorts of things that you want to specify for an APRS syntax are a bit easier in ABNF. Some might also find the syntax of the rules a bit less intimidating.

I believe that the process of developing an ABNF specification for APRS would be a useful exercise. I suspect that the process will help identify ambiguities in the protocol specification and perhaps even in the protocol itself.

(For what it is worth, somewhere I have ABNF specifications of the TNC-2 and Timewave/AEA MONitor command output formats. About the only interesting thing I learned it that the data stream from the APRSServe contains some stuff which isn't exactly either format, (rather, sort of a mush of both formats).)

Focus...Daniel-san. :o)

Keith is right. Let's not forget in our haste that we are focused on only one thing now: clearly documenting (for the masses) what presently *\*is\** -- not what would be nice for the future (like the direction of the "objects thread").

There will be plenty of time to discuss both enhancements and reductions to the protocol after we have our baseline publicly defined (in language even eeeeeediods like me can understand).

Thanks for the reminder, Keith.

Dave,

I just wanted to explain public-key cryptography. I find it fascinating.

Dave, I agree that adding cryptographic code to APRS would add a lot of complexity. I couldn't imagine trying to program those algorithms in PIC assembler.

In addition, the U.S. Government considers strong encryption "munitions" just like atomic and biological weapon components. They have rules banning the export of software containing strong encryption to other countries (you can, however, publish the code in a book and export it because in that form it is protected by the 1st amendment, go figure). The rules are unclear about using it only for authentication.

I think this is a good time to remind everyone that what we are supposed to be doing is finding errors, omissions, and things to be clarified in the proposed protocol spec, NOT attempting to add new functionality at this time.

In the tired cliché of my information technology (IT) friends we are trying to specify the protocol "AS-IS" and not "TO-BE".

I think a BNF description of the protocol would be a good idea, too.

I'll go back and lurk in my corner now.

Neil Johnson

Bob, Mark, and Keith

Thanks for the protocol document, it is informative and  
I've been waiting to see something like for some time.

I am here to add my comments the discussion. Please be  
aware that I understand how much effort it is to write  
a specification, so don't take the comments as personal  
attacks. In fact they are meant to help.

I have sections of comments. 1) is current version of the  
draft, and 2) general comments on the structure of the  
document.

----- 1 current comments -----

Page 1. "This draft is for comment on the CURRENT protocol ONLY".

I don't know how long this document is intended to stick around, but "CURRENT" is ambiguous. Perhaps a date would be better?

Page 1. Include a notice where readers can check for newer versions of the document. Copies of documents have a life of their own. Someone may pick up an old version and assume it is the newest version (or not be able to find a newer version). Put the URL for the appropriate TAPR page somewhere here (or your website, or what ever).

Page 1. I notice that the document is copyrighted. Please include a statement regarding restrictions of the use of the document. Copyright prevents me from stealing the document and representing it as my own, but does it limit my use of the protocol? What can I write, or not if I refer to the document?

Page 1. You might want to include e-mail contact information for each of you.

Page 3. "Destinations" - the "xxx" for the version number is unclear. Must it be all numeric or are other characters allowed?

Page 4. "Third Part Format". The format character "}" should be quoted in the text. In fact all special characters should be quoted throughout the document. For experimental, what happens when two people in the same area are using Z100? Can I include perhaps the suffix of my call sign to disambiguate? Perhaps I might use something like "Z6ZT" (i.e. Z + KN6ZT)

Page 4. "Time Formats" - "recently only zulu formats are transmitted on the air". This is a historical fact, but what does the protocol now expect? For instance a stronger statement such as "only zulu formats are to be transmitted on the air".

Page 8. "Weather Report" - "The first character indicates what version of APRS". First character of what part of the string? How is version indicated here? "W" means windows, but doesn't tell me if it is WinAPRS 3.2 or 2.0. Should there be a character for manually entered weather information? "See WX.TXT" - where is the file "WX.TXT?" This document needs to be complete to describe the whole protocol. At least provide a reference on the first page, like you did for the other documents.

Page 8. "Mic-Encoder" - An example and packet break out is needed here. I can't tell how things are encoded from the definition, and certainly don't know how to decode it.

Page 12. Queries - "?PATH?" - "not implemented yet" is probably

misleading. You are specifying the protocol, not a particular implementation's version of the specification.

Page 13. "First character definitions" - Please include the hexadecimal character values. This makes it unambiguous as to what character of which you speak.

Page 14. "Definitions" - There are many APRS specific terms in the text that should be included here. One example is "net cycle". Net cycle is defined in the design philosophy section. All definitions in the same place make it easier for a reader to find what he is looking for.

Page 15. Item 4. - "APRSdos automatically adjusts its net-cycle..." Instead of calling out the behavior of a conforming implementation it is better to specify how an implementation must deal with this situation. (If that happens to be how APRSdos is written, that's great).

Page 17. "Appendix" change "not used" and "avail" to "reserved for future use" so you have explicitly saved something for the future. This will prevent other developers from usurping these.

Page ????. I think I have missed the telemetry format?

----- 2 General structural comments -----

I understand that the purpose of this document is to a) document the protocol and b) provide a document so that others can use it to develop new tools. Given this I have some comments on the general organization of the document. Again, please don't take these as attacks but rather a bit of my twenty years experience reading and writing software specifications. I believe you are trying to write a document that will be valuable for many years to come, and as such the effort you expend now really worth it.

\* Generally items like design philosophy and definition sections come first. This helps the reader get a "feel for the terrain" before jumping into the nitty gritty details. Moving them up front will improve the overall flow of the document very much.

\* There is a great deal of information in the document. I had a hard time wading through it because of organization of like related topics was not apparent to me. A more "outline" type of form will make it very clear to new (and returning) readers how things are related.

For instance something like:  
Design Philosophy

Definitions

Notes and restrictions on use of this document

Implementation

- Basic AX.25 use - UI frames, etc.

- Retries

- Orig call sign use

- Dest Call sign use

- etc.

APRS Message types

- Position

  - Message format described

  - Position ambiguity

  - PHG

  - etc.

- Weather

  - Message format described

  - Limitations derived from different weather stations

- Telemetry

Don't take this example literally, it is meant to illustrate a technique, not what you need to do since only you can figure that out.

\* For each description of a message type, include the example in that section. It is much easier to relate an example to the description when they are on the same page. The appendix is too far away (too much page flipping). Additionally for complicated message types and schematic such as that included in the "Power-Height-Gain" format is very useful. The tabular format is fine, but when there are too many elements in a message it is difficult to track between fields and their descriptions. This is a human cognitive issue. Weather report is complicated enough that it could use it.

\* To BNF or not to BNF. I saw an earlier suggestion about adding a BNF format. This is an excellent idea. Another suggestion about using an AX.25 style block notation was also floated. This too is a good idea. When defining protocols such as this you need both diagrams and text. Something that are hard or impossible to explain one way may be described with ease in the other way.

\* Be explicit about what must be interpreted and how. This is useful for determining if an author has written a conforming implementation of the protocol.

\* You should have section discussing, in general, the units used for measurements and values. Because this is pervasive

throughout the protocol it is important to be explicit with this?  
For instance, can a European station build packets in Metric?  
(I think the answer is "no", but if my only introduction to  
the protocol was in this document, I might make a mistake).

\* I understand you are trying to write the document so that "average"  
people can understand it. This is great and means you don't need to  
use 25 cent words like "state machine" or "isomorphic decomposition".  
I believe that it is very important to be complete and very explicit  
when you are shooting for a general audience. If you were writing  
only for software engineers you might be able to count on them  
to read between the lines. Since you are writing for people without  
the experience of those who practice the art of engineering, you  
need to be more explicit and more detailed (if you have any hope  
of them making use of the protocol specification).

\* In the DISPLAY Symbols document, it would be most useful  
to have the actual icons co-located with the codes. You might  
include Dos, Win/Mac, SA, etc. I realize this document came from  
the DOS package and was converted to PDF. It will also look better  
if both documents are formatted in the same style.

---- eom ----

Well, I'm sure that is enough for now. I look forward to the  
next iteration. Thanks for the hard work it is appreciated.  
If you would like any help with this project, please feel  
free to call on me.

APRSeve uses the text output of the TNC, so there is no separate  
protocol to be documented.

I don't see the word Altitude or ( /A=xxxxxx ) any where in the specification.

>From one of Bob's DOS text files:

-----  
Altitude is obtained from the string "/A=XXXXXX"  
appearing in any POSIT. Altitude is automatically extracted from the  
standard NMEA GGA sentence or from the special \$PGRMZ and \$PMGLB  
sentences, and or it can be manually entered. Note that the field MUST  
be exactly 6 characters with leading zeros.

Examples from HST log files.

-----  
212029 +212029/3936.80N/10433.12W/090/036/A=031000ft

VE2UMS-11 041133 /041534/4536.95N/07438.45W0/A=004000

W3ADO-7 @241613z3859.83N/07639.91W'131/143/A=001200

-----  
I think the default for /A=xxxxxx was to be feet ?

If Kenwood is adding the altitude to the TH-D7a in the next revision  
then how are they sending the altitude in the POSIT packet.

Steve:

The purpose of the APRSSPEC, as I understand it, is so someone presently outside of the present authors can develop APRS compatible display and tracking issues. In other words, to make APRS "Open Source".

As APRSSERVE is a integral part of this, it is imperative that it also be documented, as is spelled out in the agreement that the WG, which you are a member of, came to agreement upon.

While you are correct, it does use the "text output" of the TNC, there are other issues that need to be documented. For example, the tcp/ip port numbers that APRSSERVE uses. Also, the messaging token system you are using. Without this information, it would require reverse engineering of APRSServe to develop a internet capable "APRS display" application. Weren't we trying to get away for this reverse engineering stuff??

Or look at it another way. You need to write a description, so a programmer with the basic understanding of APRS, can successfully write a APRServe application without to many questions to you. Without the tcp port numbers, as well as the RF messaging authentication, I fail to see how this can be done.

Even if you disagree with the above (which, in my opinion, would go against the spirit of the WG agreement), you still need to document that the APRServe "uses the text output of the TNC" in the APRSSPEC document.

Thanks

Jeff

Status:

I've been reading through the MIC-E protocol spec (Crosswell/Parsons, Jun97/Dec98), and there are a few things I don't understand:

1. I believe Fig 2 shows the destination address encoding \*as it is transmitted\* That is, a protocol analyzer would display the bits as shown in the diagram. (Correct?)

When the receiving TNC processes this address, it shifts each octet one bit right, and presents the result to the user. [E.g. an ordinary (non-MIC-E) callsign letter "A" (41hex) is transmitted as 82hex, then converted back to 41hex at the receiving end by the TNC].

This leads to my confusion, regarding the ASCII value table containing the "Lat digit, Message/N/W/L Bit = 0" etc columns. I don't understand how this table relates in any way to the transmitted/received data.

To take a real example, the first octet in Fig 2 contains Ar1DDDD0. If message bit A is zero, and DDDD is 0011 (BCD digit "3"), the transmitted bits are 00100110 (=26hex). At the receiving end the TNC shifts the field one bit right, giving 13hex.

My questions, then:

- a. How does 13hex relate to anything in the ASCII value table?
- b. Does the receiving TNC actually output 13hex for (what it thinks is) a callsign character? (It's a non-printing character).
- c. Have I missed the point entirely?

2. What is the BCD encoding for a position ambiguity space character?

3. What are "custom" messages and where is the custom message bit encoded?

4. The spec says the telemetry field and the comment field are optional, and each field follows mandatory data. I assume this means you can only have \*one\* of these fields at a time, not both.

I assume also that the optional comment field cannot start with 60/27/1D hex (otherwise it would be confused with a telemetry field).

Are these assumptions correct?

Can you help?

Ian

The Mic-e documentation is difficult to understand. I hope the following  
clears up some of your questions.

Bill KC9XG

-----Original Message-----

To: APRS Spec Discussion List

Subject: [aprrspec] Help with MIC-E Protocol Spec please

I've been reading through the MIC-E protocol spec (Crosswell/Parsons, Jun97/Dec98), and there are a few things I don't understand:

1. I believe Fig 2 shows the destination address encoding \*as it is transmitted\* That is, a protocol analyzer would display the bits as shown in the diagram. (Correct?)

This is the structure of the data as provided by the TNC to the serial port.

When the receiving TNC processes this address, it shifts each octet one bit right, and presents the result to the user. [E.g. an ordinary (non-MIC-E) callsign letter "A" (41hex) is transmitted as 82hex, then converted back to 41hex at the receiving end by the TNC].

The TNC does not shift the bits. The application receiving the data would perform any bit shifting and masking.

This leads to my confusion, regarding the ASCII value table containing the "Lat digit, Message/N/W/L Bit = 0" etc columns. I don't understand how this table relates in any way to the transmitted/received data.

The data in figure 2 is provided by the TNC as individual ascii bytes. Each byte has been constructed to ensure that it will be a displayable character. The receiving application must extract the data contained in the individual bytes.

"Lat digit, Message/N/W/L Bit = 0"

This refers to .the Most Significant Bits of bytes 4, 5, and 6.  
If the MSB bit of Nr1MMMM0 is a 1 this represents North Latitude  
If the MSB bit of Wr1HHHH0 is a 1 this represents West Longitude  
If the MSB bit of Lr1HHHH0 is a 1, add 100 degress to longitude

For example : If byte Nr1MMMM0 > 127 then NorthLatitude else SouthLatitude.

To take a real example, the first octet in Fig 2 contains Ar1DDDD0. If message bit A is zero, and DDDD is 0011 (BCD digit "3"), the transmitted bits are 00100110 (=26hex). At the receiving end the TNC shifts the field one bit right, giving 13hex.

My questions, then:

- a. How does 13hex relate to anything in the ASCII value table?
- b. Does the receiving TNC actually output 13hex for (what it thinks is) a callsign character? (It's a non-printing character).

c. Have I missed the point entirely?

The TNC performs no shifting, therefore the application sees 26Hex.

2. What is the BCD encoding for a position ambiguity space character?

Have not seen this (that I know of), but it should be 0.

3. What are "custom" messages and where is the custom message bit encoded?

4. The spec says the telemetry field and the comment field are optional, and each field follows mandatory data. I assume this means you can only have \*one\* of these fields at a time, not both.

I assume also that the optional comment field cannot start with 60/27/1D hex (otherwise it would be confused with a telemetry field).

Are these assumptions correct?

Can you help?

I was connected to N9UUR this morning and observed the following packets.

N0JUP-14>RELAY>N0BKB>N0JUP-1>W0MXW-1\*>T13W4U: `y<51 k/>EMAIL:COACH1205\*HOME  
KB0PSS-9\*>RELAY>WIDE>T4PQ4X: `x<`l+ak/>ROCHESTER-MN Wiebke\_  
W3MJP>K3ATI-11\*>WIDE>T0PV6T: `g\Xo,5>/>MOBILE  
KC4XX>RELAY>WIDE\*>R8RW0U: `m1P1 j/>HANKSTER 98ACCORD

How are the multiple '>' characters interpreted? Is this a legal construct according to the spec?

The spec states :

Mic-Encoder - The Mic-E includes part of its position in the TOCALL.  
Therefore these need to be decoded by everyone.

Are these Mic-E packets? It appears that the last call in the T0 list may be a valid Mic-E location field containing Latitude etc.

N0JUP-14>RELAY>N0BKB>N0JUP-1>W0MXW-1\*>T13W4U: `y<51 k/>EMAIL:COACH1205\*HOME  
Decoding this as a Mic-e packet would require decoding the 6 characters preceding  
the ':' character rather than the T0 Call as in  
KR4YL-7>RWUW3U,K0ZXF-7\*,WIDE: `n<4!+E>/>PAUL pk@ij.net

KC4XX>R8RU5Y/V: `m4\*1 j/>HANKSTER 98ACCORD

This packet appears to have 2 extra characters in the To Call.  
What is the significance of /V in the To Call?

Decoding this packet would require decoding the first 6 characters in the TO  
CALL  
and ignoring '/V'. The previous example requires decoding of the 6 characters  
preceding the ':' character. Certainly is confusing, to me at least.

Bill, KC9XG

>Jun97/Dec98), and there are a few things I don't understand:

Replying to my own post, I see I was completely off the track. I think  
I've cracked it now, by looking at some on-air traffic. For example, 2

packets from the same station:

N2SXJ-1>APK,APS:@091543z3947.23N/07501.98W- ....

N2SXJ-1>S9TW2S,N2SXJ,W3PHL-3,KE3XY-3\*,WIDE/1:`gY~1 -/>bed station

>From the first packet, this station is at 39 deg 47.23 min N,  
75 deg 1.98 min W.

The destination in the second packet is "S9TW2S". Referring to the table in the Mic-E spec, this decodes as follows:

|             |     |     |     |     |     |     |
|-------------|-----|-----|-----|-----|-----|-----|
| ASCII Char: | S   | 9   | T   | W   | 2   | S   |
| Bit:        | A=0 | B=1 | C=0 | N=0 | L=1 | W=0 |
| Lat Digit:  | 3   | 9   | 4   | 7   | 2   | 3   |

The latitude digits match the first packet OK.

According to the spec, the A/B/C bits have to be inverted, so the message code is 101 (i.e. a "Special" message -- I wonder if this is correct?)

The N bit is 0, meaning South .....Hmmm

The L bit is 1, meaning the longitude is greater than 100 degrees ...  
HMMMMMMMMMMMM

The W bit is 0, meaning East ..... HMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMM

Soooooooo, have I \*still\* got it all wrong, or are the headings on columns 2 and 3 of the ASCII table transposed (i.e. col 2 is for Bit=1 and col 3 is for Bit=0), and should the message bits A/B/C really be inverted?

Also, the table heading refers to "Message/N/W/L" bit settings, whereas Fig 2 shows the octets in the order A/B/C/N/L/W -- i.e. the "W" and "L" are transposed. Which is correct?

Looking at several other continental U.S. Mic-E stations just now, they all appear to be South and East, which I'm disinclined to believe.

Comments anyone, please. I really need to understand this stuff.

Some more evidence. Two more packets from one station:

KR4YL-7>APRS,TCPIP,KA2TOC\*:@091146z2753.51N/08245.71W>180/041/Mic-E/M0/Off duty  
KR4YL-7>RWUR9S,RELAY,WIDE/1:`nIf Sl>/>PAUL pk@ij.net

The comment in the first packet says "Off duty". This is message code 0.

In the second packet, the destination is RWUR9S. Decoding the A/B/C bits:

ASCII Char: R W U  
Bit: A=0 B=0 C=0  
Lat Digit: 2 7 5

Inverting A/B/C per the spec, the message code is 7 (Emergency).

So I really \*do\* think the spec is standing on its head.

I am not entirely convinced that this is the case.

I believe that the objective of a protocol specification is to enable the development of interoperable implementations. I don't believe that the APRS protocol specification, as it is currently envisioned, will be adequate to permit the development interoperable APRServe or IGate implementations.

The APRServe/IGate protocol specification might include the following:

- o A brief overview of the APRServe/IGate system
- o A description of the APRServe/IGate protocol (e.g., text strings transported over the telnet protocol)
- o The format of messages forwarded by the APRS/IGate system, which appear to be either in the TNC-2 MONitor command output format or the Timewave/AEA MONitor command output format, (or, some software seems to munge the two formats together in one packet). Somewhere I drafted ABNF descriptions of the TNC-2 and Timewave/AEA MONitor command output formats.
- o The IGate status protocol (identified by the "<" APRS protocol identifier, but listed as "reserved" in the current APRS protocol specification)

<IGATE MSG\_CNT=nnn LOC\_CNT=nnn FILL\_CNT=nnn

- o APRServe/IGate comments ("#" in the first column of a line)
- o APRServe/IGate port numbers
  - 23
  - 10151
  - 14579
  - 1313
  - ...
- o A description of the redundant frames that are ignored
- o A description of any MIC-E translations
- o The APRServe/IGate authentication protocol, or at least a hint that one exists

- o A description of the characters that the APRServe/IGate system does and doesn't forward
- o A description of the call signs that the APRServe/IGate system use that don't conform to the AX.25 specification (i.e., calls longer than six characters)
- o Probably a bunch of other stuff I forgot or don't know...

I don't know whether the APRServe/IGate protocols should be specified in the APRS protocol specification or in some other document. If it would be useful and if no one else volunteers, I would be happy to write a draft of a APRServe/IGate protocol specification.

I believe that APRServe pretty much forwards whatever it receives that is close to output from the MONitor command. There are actually two formats: the TNC-2 format (which uses commas) and the Timewave/AEA format (which uses greater-than signs and has the destination call last).

Somewhere, I have ABNF descriptions of both of these formats, which include a few other things like differing uses of asterisks.

I also have a Java AX25Frame class that includes a constructor that creates an object from an APRServe line (i.e., it parses the AX.25 packets received from APRServe).

You have good points, and this stuff will need to be documented, HOWEVER, it is not part of the On-AIR protocol which is the FIRST thing that we are trying to finalize..

Also, although the stuff you ask about are valid questions, they could vary for Igate implementations, the answers to most of your questions would be recommendations and not part of a fixed protocol.

In the long run, it probably could/should be part of the same document, however I would like to finish the protocol spec itself first.

The main exception to this is MIC-E packets. APRServe, WinAPRS/MacAPRS and APRSa+ all take the Mic-E packet and CONVERT them to 'normal' APRS packets to get rid of the control characters before sending them to the Internet..

Older versions of WinAPRS/MacAPRS just send the Mic-E packets directly, and we need to make an effort to get this stations updated.

Keith, you will have seen my head-scratching over the last couple of days about Mic-E. I still need authoritative confirmation from someone that the first 6 characters of the Mic-E \*destination address\* are transmitted \*ONLY\*, repeat \*ONLY\*, using printable ASCII 0-9/A-L/P-Z characters (shifted one bit left in the packet at assembly time, just like regular callsign characters), such as in the new table I presented yesterday.

If that's really the case, then APRS and the other packages you listed do \*not\* need to do anything special with \*reporting\* a \*destination address\* with a MONITOR command. True or false?

[I know the same doesn't apply to the Information field, which \*can\* contain non-printable characters, and what you see will depend on what software you're using to read it].

The T0 address of an AX25 packet (also called the DESTINATION address) is, (by definition, of the AX25 protocol) EXACTLY 6 characters (each UPPER CASE ONLY or 0-9 ONLY) and an SSID, which is actually a 4 bit field in the actual packet.

Therefore, it MUST be a printable ASCII character and CANNOT be a control character.

What you said is correct. It CANNOT have control characters in the T0/Destination field.

We couldn't change this if we wanted to, it is part of AX25.

I believe we are talking about two different things here. My response was that anyone wanting to parse the data stream from an APRServe must be prepared to parse both the TNC-2 MONitor command format outputs

FROMCALL>TOCALL,VIA1,VIA2,...

and the Timewave MONitor command format

FROMCALL>VIA1>VIA2>VIA>...>TOCALL

-tjs

Yes, you are correct.. Anyone wanting to parse stuff from the Servers, MUST be able to handle both..

Anyone wanting to write a program that works with TNCs in general, must be able to handle both..

If someone was using either KISS mode, or writing a program that was ONLY for use with a certain brand of TNC, they would not have to..

We (the Working Group) decided to publish everything in TNC-2 format, and later have a second document that showed all of the variations from different types of TNCs..

Any/all test suites, files etc, will be published in TNC-2 format.

There has been an "addition" to the Mic-E implementation by Kenwood to identify the THD7 as separate from other Mic-E's. This is because unlike conventional Mic-E's, the THD7 can send and receive messages. Thus we need to know who is a Mic-E and who is a THD7 on receipt. If the "first" byte of the Mic-E comment field is a ">", then it is a THD7...  
The new Kenwood Mobile will use a "]"... I think...

The Mic-E TO-ADDRESS is received by any TNC and displayed in the monitor format as uppercase alphabetic and numerals only. Iv'e been on travel 4 days of every week for the last month, DCC, Kenwood, AMSAT and have not had time to get into this in detail...

The is nothing hidden in APRServe, other than the password algorith. It  
is all documented in my various DCC papers and web site files. The APRS  
WG charter very specifically states that it deals with the protocol  
itself, not the user interface or other related issues. At some point we  
will likely expand the charter to include other topics like the internet  
system and XML spec, but we must be more focused at this time.

>While you are correct, it does use the "text output" of the TNC, there are  
>other issues that need to be documented. For example, the tcp/ip port

These are on the web site, and there is no need for another application  
to use the same port numbers in any case.

>Also, the messaging token system you  
>are using.

What do you mean by message token? This is a term the authors have never  
used...

>Without this information, it would require reverse engineering  
>of APRServe to develop a internet capable "APRS display" application.

Wrong. With the APRS protocol spec, you have everything you need to write  
such an application.

>Or look at it another way. You need to write a description, so a programmer  
>with the basic understanding of APRS, can successfully write a APRServe  
>application without to many questions to you. Without the tcp port numbers,  
>as well as the RF messaging authentication, I fail to see how this can be  
>done.

>

The only thing secret is the actual algorithm for converting a callsign  
to a validation number. This must remain a secret or else there is no  
reason to have it at all, and every IGate operator's license is at risk.

I have shared it, and will continue to share it, with everyone that develops a working application that requires it.

Note that the result, if not the objective, of creating a public APRS specification is to foster the development of independent, interoperable

implementations of the APRS protocol. In this new environment "secret decoder rings" become a less realistic technique.

I believe that one question that may be useful to answer is: How robust does the APRS protocol need to be in order to meet the stated objectives, such as credibility as a tool for emergency communications? (If you suspect that I don't believe that secret decoder rings are a robust technique for an open protocol, you are correct.)

When I first talked to Bob about the ICQ Server, I mentioned that I was originating messages. At that time, Bob gave me a license to use the server as it did not compete with any existing products. He gave me the ID of APICQX. I noticed in the list that APIXX was reserved for ICOM (future use). There seems to be a conflict here.

If this is the wrong place to correct this, please forgive me as I did not see an email address in the spec.

This -IS- the correct place for this.. Thank you for bringing it to our attention.

We had 'assigned' 'I' and 'Y' to Icom and Yaesu for the obvious reasons..

Since Icom has not (yet) come out with any data capable radios and we do not know of any on the horizon, it would be easy to just assign them something else, or we could assign you something else.. APQ for example.

In either case, we need to do it soon...

You beat Icom to the letter "I", so now I would say that

APIC0x is reserved for ICOM  
APICQx is yours...

In my opinion only.... Needing ratification by the group of course.

Steve:

As we apparently disagree on what and even if any internet specific spec information needs to be included in the first draft of APRSSPEC, I will ask that a PROTEST be entered and refer this matter to the WG for vote. The issue in question is what actually was agreed upon, in writing, by the WG to provide as it relates to internet specifications in the first draft (see my comments later for more detail).

John, can you see that this happens? (as well as read along here)

Now some specifics on what you last said.

Then we need LINKS to these documents.... The APRSSPEC is supposed to be a freestanding reference document. It should include this data

or at least the links so someone not with your knowledge can develop a APRS internet linked application.

> The APRS  
> WG charter very specifically states that it deals with the protocol  
> itself, not the user interface or other related issues.

It has nothing to do with user interfaces. We are talking raw protocol and specs here. I've already made this clear.

> At some point we  
> will likely expand the charter to include other topics like the internet  
> system and XML spec, but we must be more focused at this time.

The TAPR announcement 2 *\*specifically\** states internet protocols NOW. Not deferred, not later, not real soon now. Its says with the FIRST DRAFT which is the process we are doing now. We are not talking about XML, but what is presently being used.

I quote from announcement2.pdf, on page 3, paragraph 1:

>Protocol Committee  
>The APRS Protocol Specification is the formal definition of the data elements and  
>message formats used to communicate between APRS devices via wireless or wired  
>(e.g., Internet) connections. It does not include user interface or other  
elements that  
>do not affect the content or format of these interface components.

Then from paragraph 3 it states:

>The Protocol Committee intends to publish Version 1.0 of the APRS Protocol  
>Specification by the end of October 1999. The first draft of the Specification  
will be  
>made available to the amateur radio community by the end of June 1999, and  
>comments will be accepted as defined below.

This may be the key to the disagreement here. Is it your thinking that the document is wrong and does not call for the internet specs to be released with the first draft, as it seems to state?

> >While you are correct, it does use the "text output" of the TNC, there are  
> >other issues that need to be documented. For example, the tcp/ip port  
> >numbers that APRSSERVE uses.  
>  
> These are on the web site, and there is no need for another application  
> to use the same port numbers in any case.

You've said that to me before, and I've never been able to find them. Even if this is true, YOU STILL NEED TO DOCUMENT THEM IN THE APRSSPEC. And if your trying to claim server PORT NUMBERS are an operational issue, then you should note that APRS operational specs are also in the spec. But port numbers are commonly ASSIGNED to specific apps, hence it is my claim they are NOT operational issues but SPEC

issues.

They need to be in APRSSPEC.

> >Without this information, it would require reverse engineering  
> >of APRServe to develop a internet capable "APRS display" application.  
>  
> Wrong. With the APRS protocol spec, you have everything you need to write  
> such an application.

Port numbers? Authentication? the process to connect to the server?, the  
status messages on port 14501? NONE OF IT IS THERE. Its needs to be  
referenced in the APRSSPEC document.

> >Or look at it another way. You need to write a description, so a programmer  
> >with the basic understanding of APRS, can successfully write a APRServe  
> >application without to many questions to you. Without the tcp port numbers,

> The only thing secret is the actual algorithm for converting a callsign  
> to a validation number. This must remain a secret or else there is no  
> reason to have it at all, and every IGate operator's license is at risk.

While this may very well be true, the charter of the WG doesn't call  
for partial disclosure as I read it, it calls for full disclosure. See the  
next comment.

>  
> I have shared it, and will continue to share it, with everyone that  
> develops a working application that requires it.

Since there appears to be a legitimate reason not to disclose this, then  
you need to include the above statement and process in the APRSSPEC.  
In other words, go on record both with the process to obtain the  
validation number as well as your commitment to do so along with  
any conditions you may have. And put this in the spec. Also, it  
might not hurt to put that specific "secret" algorithm in escrow  
in case something were to happen, and you were unable to provide  
it, it could still be obtained.

If you still don't agree with me... fine, but lets let the WG make  
that decision, not you.... I still say there is a OMISSION  
with regards to this part of the document.

And in closing, I quote Tim Salo's excellent message of Sunday

October 10th, to which the WG was silent to. I think the spirit of what he is saying needs to be considered as well as noting he offered to do the work himself. You might consider taking him up on his offer as he clearly has a good handle on things.

Jeff, I've noted your request and will make sure that it's included on the list of items for discussion.

However, I think I need to say that the group didn't contemplate that the comment process would include anything like a "protest" and I do not believe that they feel obligated to accede to external requests for formal votes. I suspect that your request will be considered in the same way as the other comments received, and the WG may or may not have a vote on it.

John

Understood. But the question here is does the WG feel obligated to  
comply with written agreements they all(?) agreed to? This is  
a serious issue and what my "PROTEST" was meant to address.

What is your reading of the agreement? Should  
internet specs be released with the first draft, as apparently is  
stated in announcement2.pdf? We have had  
two or three non-WG people say yes, they should be, and one  
WG member say no, they will not be. What do you think?

And what really is the true spirit  
of the APRSSPEC? Mumbo jumbo or something that really  
can be useful to a third party developer? This is the root issue,  
and the one I hope the WG set out to resolve.

Thanks

-Jeff

Jeff, I can't speak for the group on what they think should or shouldn't be part of the specification. But as a very practical matter, the focus now is to document the on-air protocol and that is what the draft is addressing. Believe me, there's plenty to do in that space!

The group members are all subscribed to this list, so they've heard your arguments (in addition to my more formal transmittal that will come at the close of the comment period). I can't say what they'll decide (and, by the way, I don't have a vote except as a tie-breaker), but I can say that your request has been heard.

John

Jeff..

I think you are missing the point..

I agree, a person SHOULD be able to write an application that receives data from the internet using JUST the APRS-Spec document.

I feel that they CAN write such an application with just what is being presented. There is NO extra information needed..

The FIRST person to hook up MacAPRS to the Internet was someone OTHER than me.. I don't even know if Steve was first or not..

However did it, did it WITHOUT any help from me, in fact, they did it without me knowing it COULD be done..

This is going to take a little bit of explaining so bear with me a minute..

The Macintosh has a Communications structure called the COMM TOOLBOX. There are MANY different CONNECTION TOOLS. The USER sets up the COMM TOOLBOX from the SETTINGS menu of any program that uses the COMM TOOLBOX.

Some of the common TOOLBOX connections are:

- SERIAL TOOL
- MODEM TOOL
- TCP/IP TOOL
- etc

Each of these tools has parameters that have to be set BY THE USER so they will work.

To use MacAPRS with a TNC, you use the SERIAL TOOL and configure it to be 9600 baud (or what-ever), 8 Bits, 1 stop, no parity etc.. And you select which port you are going to use.

To configure a communications program using the MODEM tool, you set up the baud rate, the phone number, the data bits, the stop bits, the parity, etc, and you select which port you are going to use.

To configure a program to use the TCP/IP tool, you set up the HOST NAME and the CONNECTION PORT, the DEFAULT for Telnet is 23.

Now, the person that FIRST used MacAPRS on the Internet found a TCP/IP tool that -I- did not know about at the time, and configured it to talk to WA4DSY's TCP/IP based APRS reflector (for lack of a better name).

LOW AND BEHOLD, MacAPRS was ON THE INTERNET, and WORKING!!!!!!!!!!

There was NO, I repeat, NO, ZERO, NONE, ZIP, extra work on my part to make it work, it JUST WORKED..

The REASON why it worked is the PROTOCOL is no different..

Now, since that time, we have added the THIRD PARTY TRAFFIC concept, which -IS- documented in the spec (it may not be complete, but it -IS- there)

As for someone wanting to write their own version of an APRS Server, the functions of the internal workings of the program(s) is NOT part of the spec.

The functionality of a SERVER is not really part of the Spec.

The data that the server has to understand, is really ZERO if you get down to it, take data in (-ANY- data) reflect it back out..

Now since Windows does not have a slick communications tool box system like the Macintosh, we had to write EXTRA code to make it receive the data via TCP/IP,, But we did not write ANY extra code to decode that data.

On the other end of the stuff with a server.. The only 'standards' are that most people are using is

Port 10151 for ALL of the data  
Port 144390 for the LOCAL data only..

There is NOTHING that says a person has to do this, nor is there any real reason to insist that the operator of a server even stick to this 'standard'.. Therefore, this fact is NOT part of the spec in any way shape or form.

If someone wanted to say this was the STANDARD, then someone in Europe that uses a different port would complain because they do not use 144390, same goes for Australia and other parts of the world.

The ONLY thing that is not being divulged is the hash codes, and Steve will give that to anyone that is ready for it and will agree not to release it to the public..

Keith

I have read much of the information passed by on this subject, and understand some of it. I have a suggestion for implementation on the Internet addition. I am by no means an expert. My expertise is in Data Communications, LANs and WANs and switching.

The APRS spec is version 1.0, let's go one step at a time. If we advance this in a step process covering one aspect at a time there will be less

margin for error. Let 1.0 provide a spec for APRS itself, then maybe 1.1 provide for implementation for the Internet.

The Internet is made up of many specs. There is one for ip addressing, and then there is another one for TCP and UDP. Each is separate, and the one depends on the other. Maybe the APRS Internet implementation needs to be looked at in a layered approach. If we try and build it all at once it will take forever, because the more people that provide input the more requests there will be.

One alternative is to just encapsulate the APRS packet within a defined Server packet. The Server packet could have its own header, and the APRS packet is contained within. This technique is done on networks all over, in Frame Relay, PPP, ATM, and many others. I support both LANs and WANs and have had to deal with this methodology.

I don't feel anyone is trying to hide anything, and up until now APRS seems to work quite well, many have developed software to read and interpret the packets. You can now connect a Palm Pilot to see the data come straight off of the equipment.

The APRSSPEC listserv is there for everyone to provide comment, and peoples comment has provided. Hopefully all the members of the WG are also on the list, and they will take everyone's input into account.

This is just my opinion and a few suggestions.

73's (and I mean that deeply to all)

Scott Morris, KF4SNV

OK...the PropNET goofball weighs in on the discussion (grin) . . .

It may be a good excersize to document the "OSI Model" on which APRS is based.  
Once  
that is done (and should be done fairly easily by those in-the-know), the WG can  
point to which areas of the model they are charged with documenting.

To clarify...it is my understanding that the WG is not charged with documenting  
the  
Application Layer (the program of WinAPRS, APRSdos, XAPRS, etc.). That seems to  
be  
the domain of the person who writes the software. Nor is it charged with  
documenting  
the protocols of the Physical Layer (how a radio interacts with the ether to get  
the  
information from one point to the other). That is already done by reading the  
schematic that comes with the radio.

Their activity seems to be somewhere in-between.

An "OSI Model for APRS" would help us "observers" to focus more.

I have a a few questions, and maybe this is something that needs to be in the spec too..

WRT the serial interface, do the various versions of APRS do hardware handshake, Xon/Xoff, or nothing?

Is the serial word format defined? 8N1 702... ? I'm assuming 8N1 at this point.

I am writing code for a DF unit that will speak to APRS at minimum 19200, preferrably faster, and pass it data from GPS, TNC, DF, and another device, possibly an NMEA compass, and I am wondering about the ability of APRS to take that data stream. I can do either mode of handshaking. (RTS/CTS vastly preferred)

Do they all (or any) have the ability to receive NMEA data and DF data on the same port that the TNC is talking to? What NMEA sentences are supported/required? I have the ability and resources to translate whatever I get to a standard format, so I don't necessarily have to use NMEA GPS units, anything with a documented (or hackable) protocol will be fine, but I need to know what NMEA sentences APRS needs to function properly.

I know in the past this has been done with a switch arraingement, but given that APRS expects data on the serial port to be error-free, this seems unwise to me, as there was no mechanism to prevent chopping the other device's datastream in mid-flow. This results in half-packets, munged data and callsigns. My approach is to buffer the data and present it to APRS in ordered groups, so that none of the data is lost or destroyed.

I did notice that the N8LUE DF format is discussed, but not the Agrelo, or any others if they exist. The first char of the agrelo/micro-finder format is defined, but not the rest.

FWIW, Agrelo is defunct, and I am working with Steve at SWS to move that product line forward. There will likely be no more DF Jrs, or sadly, Micro-PLLs, unless Steve produces them. On a positive note, our new DF system is approaching alpha prototype stage, with PCBs just over a week away. It's been protoed once already, as a single processor system to test the concepts, but that hardware wouldn't have survived the mobile development environment.

I will probably support the agrelo format for my own data, and I have discussed with the Sprouls, sending NMEA TTM messages, but it's looking more like I shouldn't be the one creating TTM messages, as I may not have enough data.

I believe that a description of the protocol layers used by the APRS system would be useful. However, I don't believe that the APRS protocols were developed with a firm notion of protocol layering in mind. For example, some protocol fields are used by different protocol layers at different times. I created a description of the APRS protocol layers, but it is not something that the APRS developers would recognize, (in part because they don't appear to be thinking in terms of protocol layers).

> To clarify...it is my understanding that the WG is not charged with

As long as you provided me this opportunity to be excessively pedantic, I will note that the APRS protocols are application layer protocols. What is outside the scope of the APRS specifications is the translation between the APRS protocols and what is displayed on the screen.

> An "OSI Model for APRS" would help us "observers" to focus more.

I believe that the concept of "protocol layering" is one of the most fundamental concepts upon which well-designed protocols are build. I also believe that a protocol layering model for APRS would be a valuable creation.

(As we "advance the radio art" I would like to think that we use good science, whether it be electrical engineering, computer science, or what we know about protocol development. [Sometime when I am having a bad day, I may submit a petition for rulemaking that changes Part 97 to read "advancing the radio science" so we don't get confused about this topic...])

I usually stay out of the specifics of the protocol discussion, because I don't know what I'm talking about, but I think I can answer this one on behalf of the Group.

The protocol spec is limited to the data elements and formats used over the air. It doesn't encompass anything like the serial port specs or other elements at the hardware level.

It's not that such information isn't useful, but it's beyond what the document is trying to accomplish at this point.

Not exactly true. The "third party" protocol packets start with '}', and then the TNC text packet. These may be in either AEA or TNC-2 format. If you want to parse APRS packets, you need to be able to handle both formats.

(This may be a dupe, but my previous post didn't make it apparently)  
I have a a few questions, and maybe this is something that needs to be in  
the spec too..

WRT the serial interface, do the various versions of APRS do hardware handshake, Xon/Xoff, or nothing?

Is the serial word format defined? 8N1 702... ? I'm assuming 8N1 at this point.

I am writing code for a DF unit that will speak to APRS at minimum 19200, preferably faster, and pass it data from GPS, TNC, DF, and another device, possibly an NMEA compass, and I am wondering about the ability of APRS to take that data stream. I can do either mode of handshaking. (RTS/CTS vastly preferred)

Do they all (or any) have the ability to receive NMEA data and DF data on the same port that the TNC is talking to? What NMEA sentences are supported/required? I have the ability and resources to translate whatever I get to a standard format, so I don't necessarily have to use NMEA GPS units, anything with a documented (or hackable) protocol will be fine, but I need to know what NMEA sentences APRS needs to function properly.

I know in the past this has been done with a switch arraignment, but given that APRS expects data on the serial port to be error-free, this seems unwise to me, as there was no mechanism to prevent chopping the other device's datastream in mid-flow. This results in half-packets, munged data and callsigns. My approach is to buffer the data and present it to APRS in ordered groups, so that none of the data is lost or destroyed.

I did notice that the N8LUE DF format is discussed, but not the Agrelo, or any others if they exist. The first char of the agrelo/micro-finder format is defined, but not the rest.

FWIW, Agrelo is defunct, and I am working with Steve at SWS to move that product line forward. There will likely be no more DF Jrs, or sadly, Micro-PLLs, unless Steve produces them. On a positive note, our new DF system is approaching alpha prototype stage, with PCBs just over a week away. It's been protoed once already, as a single processor system to test the concepts, but that hardware wouldn't have survived the mobile development environment.

I will probably support the agrelo format for my own data, and I have discussed with the Sprouls, sending NMEA TTM messages, but it's looking more like I shouldn't be the one creating TTM messages, as I may not have enough data.

Greetings -

I've just joined the mail group after finding the draft APRS standards on the TAPR web site. Because I am in the middle of writing some APRS code, this is exactly what I have been looking for. This also means that I have been looking at the documents very critically, to see whether they answer a program writer's crucial questions.

Since I have just joined, I am not yet aware of points that may have previously been discussed. If I am covering old ground, please accept my apology.

=====  
ITEM 1:

I see major weakness in the documents in the tendency to refer to operation of existing software. For example, the Symbols document says this near the bottom of the first page discussing "symbol characters":

"Press F1-S in APRSdos to see these symbols. Some symbols may have a numeric overlay character 0-9 or A-Z. These are shown on the F1-S display with the numeral "3" overlaid."

First, it is factually incorrect because "A-Z" are not numeric

characters. But, more importantly, this style of presentation is verboten in any standard I have ever seen because it refers to a specific software implementation which is not necessarily duplicated in other implementations. That is, the description includes things that are not relevant to the protocol. Saying that a particular key is pressed or a specific menu is accessed should not be part of the protocol description. One might, perhaps, say:

"The symbol characters are intended to have an overlay character 0-9 or A-Z. Some software implementations allow you to see the character with a fixed overlay such as '3' ".

One can certainly refer to support documents for various software implementations so long as the documents are (1) widely available and (2) platform neutral.

This same problem appears in the Symbols document in "Areas".

This leads further to the observation that a color-filled area need not behave as described (and it is not even necessary that a program use a "PList"!)

A similar problem is in the "VALUE SIGNPOSTS" section. There are really two problems with this section (on the last page of Symbols document). One problem is that its vague but is a useful clarification for programmers.

The other problem is the reference to specific software implementation. One might, instead, write:

"Signposts are intended to display as a yellow box with a 1 to 3 letter overlay without name or callsign. You specify the 1-3 character overlay by enclosing them in braces in the comment field. Thus a VALUE Signpost with {55} would appear as a sign with 55 on it. This was designed for posting the speed of traffic past speed measuring devices. They can be used for any purpose. To avoid cluttering the map, they should ONLY be displayed on fine-scale maps (say, 8 miles or less)."

=====  
ITEM 2 - symbol list

A second philosophical point concerns how the symbol list is viewed. Understandably, the original (fairly small) symbol table could easily be viewed as a primary table and secondary table. Now, such a distinction seems quite uninforming. There is simply an ordered pair of characters that specify a symbol in one big table. One character pair is used by the GPSxyz format and a different character pair is used with certain position reporting

formats. There is no "primary" or "secondary" about it! This is particularly true with the changes in handling the coding of overlay characters. Once this was done, it is just "a symbol table indexed via two sets of character-pairs".

=====

I have some specific questions about the symbol list which will be sent as a separate message to avoid making this too long.

Thanks for all the great effort that everyone has put into APRS. I hope that I have not stepped on anyone's toes because that isn't my intent. I do have some frustrations, however, as a programmer, due to poor protocol descriptions and I hope that the protocol standard document will help solve that problem.

Here are some specific questions about the Symbols document. My point in asking these questions is two-fold. First, I would like to know their answers. Second, if I have questions, others must also.

=====  
A. GPSxyz symbol coding -

What happens to the 3rd code character in 2-character codes? Does the GPSxyz become GPSxy or does it become GPSxy(space)? That is, for a small aircraft, would one use "GPSBH " or "GPSBH"?

=====  
B. Symbol Table -

What is "HELO"? Is it short for "helicopter" or is it short for "hello"? Or, something else?

=====  
C. Symbol Table -

Does "shuttle" refer to a shuttle-bus or to the space shuttle?

=====  
D. Symbol Table -

Why the reference to "Satellite/Pacsat"? Does it refer to any satellite? Or is it to refer only to Pacsat? Then again, is not a Pacsat a satellite?

=====  
E. Areas -

What are the "offset" values references in the Area format? Offsets measured from what?

=====  
F. Typo in "HURRICANES, TROPICAL STORMS and DEPRESSIONS"...

"yellos".

=====  
G. In "SYMBOLS ON MAPS!",

how does one "permanently embed" a symbol on a map.  
Are we talking about how some program works, or are we talking about over-

the air protocol? If its over the air, how does the symbol become  
"permanent"?"

Is it transmitted forever, or does it get saved by other machines and is  
displayed forever? If it is not part of the over-the-air protocol, then why  
is it here?

=====  
H. A general plea: please more concrete examples. I am especially concerned  
about value signposts, areas, and a variety of packet types that include  
symbol characters.

It is a callsign and is always sent by the TNC as 6 bytes IAW with the  
AX.25 spec.

Often, APRS is used with port-sharing devices that have the effect of trashing packets when they un-intelligently switch from one source to another.

There is no mechanism in place to prevent such trashed packets from being interpreted as valid data.

I realize that this is, again, not an on-air issue, but I think it's significant.

Greetings -

After reading the Protocol description in detail, I have a lot of comments and questions. If this has been covered previously, my apologies.

Here are 3 comments about the existing format. Format IS important, because a consistent format reduces ambiguity.

=====  
First, a format suggestion. Please put it into a some sort of hierarchical format! Its hard to tell where you are from just the heading sizes, and when its reproduced in text-only format (as I have already had to do since the .PDF files are not down-loadable, at least with MSExplorer/Win95), its almost impossible to tell where you are in the description, and what belongs to what. What I mean is like the following (it does not have to use exactly this style):

## I. Heading

I.A. Section

I.B. Section

I.B.1 subsection

I.B.2 subsection

etc.

=====  
Generally ....

Inconsistent symbols seem to be used when "a general number" is intended vs "a general letter, A-Z" is intended. Please, please, make an attempt to be consistent, because it makes interpretation very difficult. For example, "BLNa" appears to use the "a" to signify an alpha. But, other places, such as "GPSxyz", other characters are used. Similarly, "n" seems to be used to represent a number in some places and "#" in others, but maybe not, I can't tell for sure.

In other words, put it right up front..

"In the following text, unless specifically stated otherwise, '#' shall represent a single numeric digit, 0-9, '@' shall represent a single alpha character, A-Z or a-z, and '|' shall represent any printable ASCII character."

Or, something like that. And, then, use it!

=====  
Generally...

I would really like to see something like BNF notation used to describe

field contents. With that kind of notation, for a 1-3 digit numeric field, one might write `#[#[#]]`, that is, one digit is required, a second digit is optional, and, if there is a second digit, then a 3rd digit is optional. This greatly reduces the ambiguities and fuzziness which are all through the specification. I cannot tell, for example, which fields are fixed length and which are variable, because it is never explicitly stated. This makes for a very poor protocol standard. It is not even obvious which fields are required and which are optional in various message types.

There is nothing magic about BNF. It is simply one of several recognized format description languages. Please choose something standard, and use it.

I finally got around to reviewing the Protocol Draft 1.

I've been subscribed to this SIG for a little while and know that there have been many, many suggestions regarding clarity, omissions, and typos. (But it's great to see how much has been put down in basic form!)

I don't know what to do at this point:

- \* Compare all previous suggestions to those that I would make and drop redundancies
- \* Just list all my suggestions, even though they may be duplicates
- \* Forget about commenting -- most everything has been caught - just wait for Draft 2

Any advice? What is the next step in the process? Who makes the call on that?

Ralph, KC2RLM

Hi Ralph --

Thanks for your message; it gives me an excuse to generally update folks about what's been going on.

Ian Wade, G3NRW, has volunteered to take over the process of editing the document. He has a complete archive of the messages that have been sent to this list, and he's also been communicating with the authors to get clarifications and corrections. He has just provided the Working Group with his second draft; I haven't had a chance to review it yet myself, so can't comment on it, but based on the messages I've seen, I think he's done a great job so far. The document is now something like 60 pages, and virtually all of the blanks that were in the initial draft have now been filled in.

The WG is still hoping to have the draft finalized by the end of the month, and I think there's a reasonable likelihood that will happen. It hasn't been decided yet whether the final draft will be put out for one more round of public comments; I suspect that decision won't be made until after the WG have had a chance to review it.

So, to answer your question -- new substantive comments about errors, omissions, unclear points, etc., are still welcome, though with the number of comments that have been made, it's fairly likely that most of the biggies have been caught by now (I was going to suggest searching the mailing list archive, but noticed it's not in the TAPR search engine -- I'll suggest to Greg Jones that he add it). As to typos and formatting issues, the new drafts have changed so much that any comments there are probably obsolete.

Any comments made to this list will get to the WG members and Ian. It would be helpful if you would tag the subject line with something like "COMMENT:", "CORRECTION:", etc., so that such messages can be picked out easily.

73,  
John N8UR

I still would like to know if /A=xxxxxx is going to be part of the

supported Protocol.

Several balloon groups that used MIN/PIC chips to to decode the NMEA into posit reports striped the Altitude in meters from the GGA sentence and reported in feet. /A= was easy to tack on the end of a APRS packet.

The other important item is how the NEW Kenwood units will handle the sending of altitude.

The archive for the list has been available the whole time in the TAPR ftp area.

I have just included it into the indexed section on the web page.

Searchable:

<http://www.tapr.org/cgi-bin/wilma/aprsspec>

the Index for October:

<http://www.tapr.org/tapr/list-archive/aprsspec/9910/>

Cheers - Greg

No one said what version of APRS they were using, but I finlly got around  
to checking and APRSdos does check the NMEA for meters or feet...

The new draft of the APRS Protocol Reference specification is going through the final phases of update, and we expect to publish it towards the end of November.

This is a little later than originally anticipated -- the delay is due to the document's having grown from the original 17 pages to more than 70 over the last three weeks!

The new draft incorporates detailed packet format diagrams, the APRS symbol tables, descriptions of compressed data format and Mic-E format (with a complete appendix explaining in detail how to decode Mic-E packets), and many more examples of APRS packets in general.

There is an enormous amount of detail in the document which the APRS Working Group is now double-checking. We're sure you'll like the finished result, and will find it's been worth waiting for. Because the document has been virtually rewritten since the original draft, we will have another public comment period prior to final adoption of Version 1.0.

I'd like to thank the APRS authors as well as our technical editor, Ian Wade, G3NRW, who have exchanged hundreds of emails over the last few weeks trying to nail down obscure points in the protocol. Their hard work has made a real difference in the document we'll be delivering. I'd also like to thank everyone who commented on the original draft; all those comments have been taken into consideration for this iteration.

Will these examples be extractable to form a first pass at a  
test suite?

That's a good question. The examples weren't developed with that in mind (and I didn't develop them), so I'm not sure whether the authors would consider them to be "official" test packets or not. I'll make sure we discuss that question.

John

Bill asks -

>Will these examples be extractable to form a first pass at a  
>test suite?

Clearly, no.

Some (if not most) of the examples are hand-built for the purpose of illustration of the piece of protocol being discussed at that moment. While I suspect that most will "pass", I'll bet there are a number of examples that are good for the immediate topic but will crash and burn somewhere else.

A test suite will have to be addressed as a separate issue.

To echo Mike's comment, although the new version of the spec has many  
more examples than the first version, there are still nowhere enough to  
fully exercise APRS software. Building a proper test suite will not be a

5-minute job.

But I figure the guys who know are probably here :)

In communicating with a TNC, what's the largest "sentence" one can send to/from the TNC, before encountering a <CR> or <LF>?

I've got a note here that GPS NMEA sentences can be up to 82 chars long. (yuk!)

I'm trying to figure out how large a comm buffer to allocate, assuming that I have to buffer an entire sentence to each device and from each device.

Well, that depends on which protocol you are using between the host and the TNC.

The maximum size of an AX.25 packet, ignoring flags and FCS, is:

|         |                                   |
|---------|-----------------------------------|
| Address | 70 bytes (10 addresses * 7 bytes) |
| Control | 1 byte                            |
| PID     | 1 byte                            |
| Info    | 256 bytes                         |
| ----    | -----                             |
| Total   | 328 bytes                         |

But, this answer makes sense only for KISS mode. Furthermore, you never need to encounter a <cr> or <lf>.

When receiving in TNC MONitor command format, one could construct an AX.25 packet with 10 addresses (source, destination, and 10 "via" addresses) and 256 bytes of data and get:

for each call:

|       |          |
|-------|----------|
| call  | 6 bytes  |
| "-"   | 1 byte   |
| ssid  | 2 bytes  |
| ">"   | 1 byte   |
| ----- | --       |
| Total | 10 bytes |

for a total of:

|         |                                              |
|---------|----------------------------------------------|
| Address | 111 bytes (10 addresses * 10 bytes plus "*") |
| Info    | 256 bytes                                    |
| -----   | ---                                          |
| Total   | 367 bytes                                    |

Or, you can make a bunch of assumptions that you won't ever get really big packets...

(These might make good packets for an APRS test suite.)

>(yuk!)  
>

According to the Garmin 25 manual which contains the NMEA sentence  
details, the max lengths are as follows:

|     |     |
|-----|-----|
| GGA | 72  |
| GSA | 65  |
| GSV | 210 |
| RMC | 70  |
| VTG | 34  |
| RME | 36  |
| RMT | 47  |
| RMV | 26  |
| RMF | 79  |
| GLL | 36  |
| VTG | 34  |

These include CR LF.

So I guess GSV (Satellites in View) is the one you have to allow for.

```

Technically speaking, there's nothing preventing one from receiving a very large frame, even if the frame is not strictly AX.25 compliant. I recall that some of the 56kb experimenters were interested (for fairly obvious reasons) in frames with a payload greater than 256 bytes.

Granted, you're not likely to find such frames on a common 1200 baud channel, but I recall that a number of TNCs are capable of sending frames larger than the AX.25-specified maximum. If a piece of software decides to send a frame larger than the max, the TNC is liable to comply.

```

> Or, you can make a bunch of assumptions that you won't ever get really
> big packets...

```

Such assumptions should have a deterministic behavior when you \*do\* get a large frame (perhaps as a fluke). I'd suggest an assumption along the lines of "you don't have to process such frames", rather than "you'll never get 'em".

N7IKQ, KA7ZQL and myself are trying to put together a system to report Phoenix freeway traffic conditions on packet. Both of these gentlemen work for the AZ freeway management system division of ADOT and have gotten permission to do this. The data available consists of traffic volume and speed measurements every 1/3 of a mile by means of sensors embedded in the pavement; the text that is displayed on those orange message signs; info about onramp metering; and info about "incidents" (accidents, construction or other traffic snafus). Obviously some of this data fits well into existing APRS message types. I read the spec about a week ago and discovered the "traffic sign" type which had as an example usage, the speed of traffic past a certain point. However it bothers me that it is limited to 3 digits, and no way of specifying units, and how this info will be used by APRS clients is ambiguous. My expectation would be that a typical client would display it as if it really were a highway sign showing drivers their speed as they go by. However more data is available than just speed - we also can know the "occupancy" which is a measure of how bumper-to-bumper the traffic is; speed for each lane separately; and volume of cars per hour. At azfms.com there is a color-coded map showing different colors for different speed ranges and I would like to incorporate or see someone else incorporate that kind of display into an APRS client. But it must be possible to separate that kind of data from other measurements of congestion; perhaps the client would give a choice which measurement to use, or show multiple color codes at the same time. The client could also have a text display of just the upcoming situations which are relevant to the driver, for the next 5 or 10 miles in the direction he's headed; and this text could be spoken by a voice synthesizer whenever it changes.

Anyway I suppose the sign messages, and incident reports, would fit in more generically, but I didn't see a good way of sending different APRS messages for these two types of data, other than just prefixing the sign messages with "SIGN:" or something like that.

New measurements of speed etc. are available every 20 seconds. I am aware the typical APRS update frequency is 10 minutes and that more often would

congest the frequency too much for its general-purpose nature, so we are thinking of using a separate frequency to send more detailed, frequent updates. I think in the interests of unification that I would like to try sending this data in XML format on the separate frequency (it would have seemed like a good idea anyway, but the DCC presentation on XML for APRS provided some more inspiration). Of course it will have to be a fairly compact form of XML (tags kept as short as possible) to fit in a 1200 baud channel, even assuming the channel is transmit-only and we can max out the available bandwidth. It appears that standard APRS messages are already too complex to decode easily (too few rules and too many exceptions) so stretching it even further to make new message formats to handle all the data types that are available would probably be a mistake. Trying to shoehorn the data into generic text messages would provide no incentive for APRS client software to try to display it more concisely as with color codes, and voice updates of only the data relevant to your position and direction, and things of that nature; you'd just end up with a screen full of icons and have to click on each one to find out what it says, and that would be useless if you are trying to drive at the same time. On the other hand it would be useful for APRS clients to be able to interpret the APRS XML DTD anyway, regardless what the source of that data is; and this might be the first on-air use of that DTD, with others following and having an extensible standard to work with rather than the ad-hoc APRS packet formats.

N7IKQ thinks the faster updates on the secondary channel should be by request only, in which case the channel would not be transmit-only, but the data sent could be targeted to what a particular user requested (give me the speed data for the next 5 miles of I-10 for example) rather than sending all the data all the time. Of course the more people are requesting data, this starts to become a losing proposition because most of the data needs to be sent anyway, yet we are also losing bandwidth to incoming requests and making the software more complex too.

In any case we want to provide whatever functionality that can fit into APRS protocol, on the normal APRS frequency so people don't have to use two channels at once if they don't want to.

Judging from the way APRS is used, there seems to be some loophole to get by the "no broadcasting" rule; I'm wondering what this is? Obviously the AX.25 "to" field is filled in but not usually with an individual ham's callsign. I don't want to raise a ruckus about that, just curious how it would be justified if the FCC asked.

I'm working with Linux of course, and this afternoon started with the beacon source code to find out how to open a socket and send packets. That's easy enough, now I just have to figure out what to send.

I'm open to suggestions on how to format the data, or otherwise.

lines  
> of "you don't have to process such frames", rather than "you'll never get  
'em".

It gets really fun when you try to think how to know where you are in all  
this, given that there's no real protocol, and all the control of the device

is also in-band.

It's a lot like initializing a hayes modem. There's no way to do that, which will always work.

My favorite Hayes-ism: "Restore to factory defaults".. As if that helps, given that there's no way to know what that is..

Shawn,

The "Speed SIGn" in APRS is only the ICON display, the OBJECT itself still has the potential for having the 35 character "comment" field and if needed, the same "object" can send a full 63 character "STATUS" line as well.. Thus you have plenty of opportunity to embed other info in the object. Only the SPEED shows on the MAP ICON, but all the rest is displayed when you "click" on it...

Also, you can send general data as BULLETINS...

Or you can send "areas" which are boxes, triangles, circles and lines to enclose traffic congestion etc...

Does that help? I think the tools are mostly in there.. Just needs some creativity in sending the right packets...

Bob, WB4APR

I guess I missed that.

Any comments on this?

It seems to me this has been addressed before in the sense a packet "broadcast"  
still has a specific audience, hence it is not a "broadcast". I know this has  
been

addressed in other UI modes of packet previous to APRS. I don't think you  
have much to worry about.

I think a bigger issue for you might be the usage of amateur frequencies by the Arizona Department of Transportation..., either directly or for there benefit.

-Jeff

```

It doesn't benefit them in any way; they have landline and microwave networks for their own purposes. This is a service to us hams, being initiated by hams and with a ham in charge of it within the ADOT building where the antenna will be located. I don't see a problem with it. If the antenna being at their building were the source of a problem then we could locate it elsewhere and send the data to the alternate location via the Internet.

Sorry about that then. I think its a good use.... you were just asking  
some basic questions so I mentioned this. The reason I did is we  
have a project exactly like that here in Detroit. It is funded by MDOT  
and sends the information on 220mhz (non amateur part of 220). What  
you described sounded like yet another travelers information service  
that the various DOT's have been funding as of late.

So I hope you understand my confusion of your intent.

-Jeff

APRS is a network. Everyone transmits to everyone else in the network.  
Just like we do on any voice net...

I've brought this subject up before as a problem , but now I have more information.

When you choose a GPS "C" group ICON for your tracker, please do so after reading this list below.

My recommendation, is to choose one that has ICON information that matches in all three flavors of APRS. I don't have any ICON information on other flavors of APRS.

Back in August (12th) I wrote to the aprssig mentioning that I was watching a tracker near Victorville sending packets with the "TO:" field of GPSC17, GPSC18 etc. I was using APRSdos at the time, and had recognized the code as ones seen in APRSplus icon table.

The problem was that APRSdos wasnt showing any ICON for these values. Only the callsign and speed/direction vector was showing.

APRSdos only mentions other ICONS, such as the M series (GPSMx) and a list of them in APRS\README\Symbols.txt file.

I was advised that APRSDOS was suppose to decode these and I have confirmed that it does to a certain extent.

Bob B writes in a reply:

APRSdos is supposed to decode it. I'll check it...

Not knowing which GPSCxx codes work, and which don't, I wrote a program in my laptop to change the LTP setting in my mobile KPC3+ v8.3 tracker. The program changed the setting of LTP 1 to be GPSC00 through GPSC99 then beamed each value with real GPS live data on a different channel than 144.39 every 10 seconds.

I then watched and recorded what each of the ICON values did (over the air) in APRSdos 844, Winaprs 2.3.3 and APRSplus.

I have not done the same thing with the listed ICONS in Symbols.txt that comes with APRSdos.  
I'll do that another day.

Below are the results of running each GPSCxx code through each program. The biggest problem I came up with, is, APRSdos doesn't display ANYTHING as an ICON for a lot of "C" codes. Any place you see -- in the DOS column, it means no ICON is displayed on the screen of APRSdos.

-----  
ICON displays for "C" group GPS tracker "T0:" addresses. See note 6 below for information about "E" group values.

| GPSCxx value | DOS Note 2<br>APRSplus note 2 | Winaprs                         | Note 2                          |

#### Notes:

1. APRSplus - There isn't any selection buttons for 96-99 inclusive
2. APRSdos - version 844, Winaprs 2.3.3, APRSplus version unknown, but aprox 6 months old.
3. APRSdos "--" icon means, that \*NO\* ICON was displayed on the screen at all. Only the  
callsign and RMC direction "spear" show.
4. GPSC55 doesn't display the callsign correctly in APRSdos 844. Its Jibberish.  
It looks to be part of a WX display instead of callsign.
5. The descriptions of all ICONS are subject to my interpretation, and I may have  
gotten clues from other versions of APRS as to what they might be. For some ICONS I just  
cant tell what they are.
6. There is a GPS "E" group shown in APRSplus Secondary table tab. Both Winaprs and APRSdos  
define all values of GPSE00 through GPSE99 as a "jeep" symbol, although there are many ICONS  
choices in APRSplus "E" group.

What a f-a-n-t-a-s-t-i-c piece of work this is! Well done, Byron!

Now for an extension of the experiment...checking to see how javAPRS displays  
posit icons. Although  
anyone is welcome to beat me in the attempt, I will try (over the next couple 'o  
days) to launch  
gpsc### icons into the igate system, and view the result on the javAPRS system to  
see what  
happens...and add the results to the list, too. As an aside, one wonders that  
correlation exists  
among other gpsc### codes as well.

Again, well done, Byron!

With respect to APRS+SA, one can edit the files SYMBOLS.BMP and  
SYMBOLS2.BMP in the APRS+SA directory, and create any symbol for any icon  
you wish. Obviously, what you then see and what other see will be different  
if you do. The files are simple bitmaps 16x1538 pixels in size. A new icon  
every 16 pixels. In the future, I may compile them into a DLL, but for now,  
they are open.

Brent

First, if you do this, please make sure the positions are legit, rather than sending a couple hundred bogus positions. If you really want to do this, running javAPRS locally is a better answer.

However, doing this for javAPRS is largely a waste of time. I am well aware of the fact that the javAPRS icons are out of sync (as well as the fact that all the other versions are out of sync with each other). The underlying problem for this is the lack of a standard. Once this very

time-consuming process is complete, the authors will be bringing their versions into alignment with the standard, the icons are only one small part of the work that will need to be done.

For javAPRS, the icons are in 4 GIF files (primary and secondary icon sets for light and dark backgrounds), each holding 96 different icons. The icons must be copied into the light background GIF, moved to the dark background GIF and edited to appear nice on the dark background. This is a slow, tedious process, and one I haven't done for years, which is why the icons are out of sync.

Anyone that wants to tackle this, please feel free!

Steve K4HG

Brent and others

In MacAPRS a user can go in with Resedit and change the icons, the same goes with WinAPRS if you have a development environment and the resource editor for windows applications. HOWEVER, this should NOT be encouraged. We need to have the icons the SAME on all of our platforms. Byron has done a wonderful job for all of us, we should all strive to make them the same. Now it does NOT require that your blue car look like my blue car, but they should BOTH should be "blue cars"

My \$0.02

Mark

In the spec, there is discussion of the WIDE, TRACE, RELAY etc..

There is no discussion on ECHO.. This is STILL being used on HF,  
mostly by MOBILEs.

I am -NOT- commenting on if this is correct or not, because I do not  
know.. If it IS supposed to still be used, it should be documented..

Bob, What say you? Again, I have not comment pro or con.

Good point. The use of "PATHS" is fundamental to APRS and is the number one question of newbees'. I can imagine tho, that others will say it should not be in the spec... But could it be an appendix or something?

I dont have spe c with me, but to the extent that W,R,T are in there, then ECHO should be too..

Bob

A couple of thoughts:

- o The audience of an APRS specification should be developers, not users. The objective of the spec ought to be to enable the development of interoperable implementations. That is, it ought not be a tutorial, (which is not to say that a tutorial would not be valuable, merely that a tutorial ought to be a different document).
- o An APRS specification ought to specify the operation of digipeaters. As Bob observed, this is a fundamental part of the APRS system.
- o A good argument could be made that there should be several APRS specifications. This will allow the individual specifications to evolve independently. For example, the operation of digis might be more likely to evolve than the base protocol itself. It would be nice to release a new digi specification without having to release a new APRS protocol specification. Three specifications come to mind, I think there might be more:
  - APRS protocol
  - Digi and forwarding operations
  - IGate and APRServe operations

Note that an APRS station would need to implement portions of more than one document.

Somewhere, I wrote some boilerplate for an APRS specification that talks about such things as the objectives and audience of the spec. If I have a few hours, I will put it up on the Web.

=====  
APRS PROTOCOL SPECIFICATION  
=====

TAPR announces release of the second public draft of  
the APRS Protocol Specification.  
-----

It's finally here! The APRS Working Group has completed the second  
public draft of the APRS Protocol Specification.

This document covers the core functionality of APRS Protocol Version  
1.0 as it works today. This is the base level specification that all  
implementations should comply with, and it was unanimously adopted by  
the Working Group members, who include the authors of APRS-DOS,  
WinAPRS, MacAPRS, X-APRS, PocketAPRS, APRS+SA, javAPRS, and APRServe,  
and the developers of the Mic-E and Pic-E products.

The Specification forms the basis for future Working Group projects,  
including APRS test suites and the APRS Certification Program. The  
WG also hopes to use this document as the basis for further speci-  
fications, including IGate and APRS digipeater operation.

Over the last 8 weeks the specification has grown from 18 pages to 93.  
It now includes packet format diagrams, the APRS symbol tables, full  
details of the Mic-E encoded format, the compressed lat/long position  
format, plus weather report and telemetry formats. Above all, the

specification contains many examples of how APRS data is formatted to make it easier to understand.

The APRS Protocol Specification is now available on the APRS Working Group web page at: <http://www.tapr.org/tapr/html/Faprswg.html>.

It is available in PDF format, both zipped and unzipped. The zip file is a little under 1.5MB. You can read it with a PDF reader such as Adobe Acrobat 3 or 4.

This document is still a draft. There will now be a 15-day public discussion period in which anyone may feed back comments, criticisms and suggestions for improvement. Full information on how to do this is contained within the document.

The final cutoff for comment is midnight U.S. Pacific time on Sunday 19 December (i.e. 0800 UTC on Monday 20 December).

After this date the Working Group will consider all the comments, and will issue the final approved version of the Specification as soon as possible thereafter.

John Ackermann, N8UR ([jra@febo.com](mailto:jra@febo.com))  
Administrative Chair  
APRS Working Group  
4 December 1999

Hi all- first of all I would like to express my appreciation for all the work in getting the draft into a very clear format.

I thought the purpose of this draft was to define the protocol as it exists- not change it.

The hurricane spec changes the order of the data in the pressure and wind field areas. This means to implement the draft a 100 % changeover in user software by the next hurricane season.

I have serious problems with what I consider "geocentric" definitions:

There are parts of the world that do not use "hurricane" for a severe tropical cyclone. They are called Typhoons, Tropical Cyclones, Severe Tropical Cyclones etc..

The winds are defined as MPH. This is a major problem due to the more universal standard being knots. Internally at the National Hurricane Center they use knots and only convert to MPH for "Public" statements designed for U.S. distribution. The vast majority of bulletins from Guam, Miami and Honolulu are in knots. If a user wants the winds to show in MPH, the display software should do the conversion.

Radius should be in Nautical Miles to be consistent with knots.

Drop the business about gusts being in the last 5 minutes- this is not real

time data but estimates of winds possible (even in "present" positions)

Time should be the "Valid" time of the object- not the time received or transmitted

As to course and speed- Forward speed in knots - 000/000 = stationary  
.../... = no parse. There is a lot of difference between stationary and "I don't know"

>This document is still a draft. There will now be a 15-day public  
>discussion period in which anyone may feed back comments, criticisms

>and suggestions for improvement. Full information on how to do this is  
>contained within the document.

Hopefully this is the correct address to send contributions. The  
e-mail confirmation message, which I received when I joined the list  
did not specify the contribution address.

Chapter 3 "APRS and AX.25" states:

>i Flag ó The flag field at each end of the frame is the bit sequence 0x7f  
>that separates each frame.

The flag sequence in AX.25 is 01111110 (in binary), thus the hex value  
should be 0x7e

In chapter 6 "TIME AND POSITION FORMATS" it is stated

```
>Maidenhead
>Locator
>(Grid Square)
>An alternative method of expressing a station's location is to provide a
>Maidenhead locator (grid square), together with a Symbol Table Identifier
>and Symbol Code, in a Status Report or in Mic-E status text.
>
>For example:
>
>I091sx/-
>
>indicates a house at grid square I091sx.
```

If only 4 character locator is available, is it represented as

I091 /- or I091/-

If the 8 character locator is available (also known as microwave locator and recognised by IARU region I), can it be represented at all e.g.

I091sx36/-

The specification does not say, if the characters should be in upper and/or lower case or if a mixed case can be used. If mixed case can be used, which IMHO it should be, then such constructions as I091sX are legal and this should then be clearly stated, so that every implementor of receiving software remembers to check for both upper and lowercase characters.

The use of non-SI (US specific) measuring units in various messages will cause some problems in countries using SI units, in which the data is both originated and displayed in SI-units. Remembering what happened to Mars Climate Orbiter once again emphasis the need for correct conversions :-).

Eg. if the original data is in kilometers and the message is in miles and the transferred data is displayed in kilometers, due to the limited resolution in the mile representation, the displayed kilometer value may be one larger or smaller than the transmitted value.

The situation deteriorates even further, if different conversion factors are used in the encoding and decoding phase. Thus it is very important to specify the exact conversion factors to be used e.g. in the glossary, so that all implementations will use exactly the same definition. At least the following missing terms should be included in the glossary:

|      |          |            |
|------|----------|------------|
| inch | 1 inch = | 0.0254 m   |
| feet | 1 feet = | 0.3048 m   |
| mile | 1 mile = | 1609.344 m |

These are exact values as 1 inch is by definition 25.4 mm.

The conversion between Celsius and Fahrenheit should be defined in the glossary, so that every implementation does it properly.

> mph miles per hour (km/hour = mph \* 1.60935. m/sec = mph \* 0.447).

Exact values should be used, since they are available, thus

mph miles per hour (km/hour = mph \* 1.609344. m/sec = mph \* 0.44704).

>knots International nautical miles per hour (mph = knots \* 1.151).

The conversion from knots to m/s should also be specified e.g.

1 knot = 0.514444... m/s

>(International) Nautical Mile 6076.103 feet / 1852 meters.

The international nautical mile is 1852 meters or 1852/0.3048=6076.115485564 ft, thus even the second decimal in the glossary is wrong.

These comments may seem to someone to be just nit-picking and indeed, the last decimals are meaningless if the data source is in US units and the display is in SI or when the data source is in SI-units and the display in US-units, since typical sensors only have 2-3 digit precision.

However, when both the data source and display is in SI-units and the messages in US units then it is very important that the SI/US and US/SI conversion are performed using exactly the same constants. Why use invented inaccurate constants when exact values are available in many cases (thanks to the definition of an inch to be exactly 25.4 mm).

The term "ASCII" is over-used and abused and can be used quite ambiguously, so it should be defined in the glossary to refer to ANSI X3.4 from 1968, or at least this is my interpretation from the context.

While the comment field in various messages can only contain printable ASCII characters excluding | and ~, however in chapter 14 "MESSAGES, BULLETINS AND ANNOUNCEMENTS" nothing is said about allowed characters, thus | and ~ as well as 8 bit characters should be legal.

However, the Message-ID begins with "{", so I do not see how this can be properly distinguished from the situation, in which the message text contains the "{" character. Is it so that the preceding text can not contain a "{" character ?

The allowed characters for status report are not specified.

In chapter 18 "USER-DEFINED DATA FORMAT"

>Important Note: Although there is no restriction on the nature of user-defined  
>data, it is highly recommended that it is represented in printable 7-bit  
>ASCII character form.

Why this restriction ?

-----

The following discussion is not relevant to version 1.0 of the specification, but I think that some provisions should be made in version 1.0 in order to not make future expansions impossible.

While English is used quite commonly in international contacts between radio amateurs, English is far from the only language used by amateurs, especially in local VHF/UHF activities (e.g. voluntary search and rescue services), in which the local language is used.

Unfortunately the 7 bit ASCII (ANSI X3.4) is far from adequate for encoding of these local languages. For Latin based scripts (Western and Central Europe, North and South America) various national versions of the 7 bit ISO-646 has been used, in which #@[\\]^\_{'|}~ characters are replaced with local variants. These national character sets have been used in amateur packet radio traffic, but is more or less obsolete in all other data processing these days.

Most data processing outside the US is done in various 8 bit variants of ISO-8859 for Latin, Cyrillic, Greek, Hebrew and Arabic. Unfortunately this seems to be too exotic for packet radio purposes, but should be adequate for local single language situations.

For multilingual communication, the rest of the world is moving towards 16 bit Unicode encoding. Unicode is the native character set of Windows CE and Windows NT, some degree of support on Windows 95/98

and various Unix dialects. Older platforms, such as MS-DOS could map at least some characters to the local code page.

There was even the UTF-7 specification (RFC 2152) that allowed transmission of Unicode over 7 bit mail gateways, but since all gateways in the Internet are nowadays 8 bit clean, there is no longer a need for 7 bit encoding, so the use of UTF-7 is no longer recommended.

A better encoding is UTF-8 (RFC 2279) which transfers 16 bit Unicode characters with 1-3 eight bit bytes. Traditional US-ASCII characters (0..127) are represented with one byte, accented Latin, Cyrillic, Greek etc. are represented with 2 bytes, while Far-East ideographs require 3 bytes.

As I said previously, these things do not belong to version 1.0 of the specification, but IMHO, version 1.0 should specify that the comment field and some other user entered text fields should be forwarded as 8 bit characters, even if all specifications currently calls for generating only 7 bit US-ASCII characters. The programmer should be aware that some day there might come 8 bit characters and it is not acceptable to simply mask of the MSB of each byte or use signed char in the C-programming language.

Paul OH3LWR

typographic errors

pg. 4 pp. 3 s. 1 -> Mr Spocks - change to - Mr. Spocks (period missing)  
pg. 4 pp. 5 s. 1 -> This document is the result of inputs from many people,  
and collated and massaged by the APRS Working Group. - change to - This  
document is the result of input from many people, which have been collated  
and massaged by the APRS Working Group.  
pg. 4 pp. 5 s. 2 -> getting it on to the street. - change to - getting it  
onto the street.

GENERAL - color descriptors

pg. 47 object color table -> DOS conventions usually call colors  
BRIGHT/normal rather than normal/DIM  
I've never run across this before... It still conveys the same information.  
Some use the convention HIGH INTENSITY/ LOW INTENSITY.

UNCLEAR - pg. 32 - 33 DFS and NRQ definitions are a little obscure. Adding  
in a table showing the implementation would be helpful. Reference is made  
to the PHG table, but you need to change the power in watts to recieved S  
units. Add another table, it's not much space, and much easier than having  
to flip pages and convert the chart data in your head.  
No definition of the signal quality report is given. It defines legal  
values being in the range of 0-9 but not what they mean. Is 0 good or bad?  
Another table would be nice.

Excellent document overall, it's sure nice to have the information all in  
one spot and presented professionally. Thank you to all of the APRSWG and  
others who are working on this document and the REAL WORLD implementation  
of this protocol!

I have studied the situation a bit more and tried to locate any  
primary documents.

Unfortunately I do not have the minutes of the meeting in Maidenhead  
1980, but the next official document is the VHF-manager's handbook, of  
which only paper copies existed previously.

Fortunately it is now available on the net at  
<http://www.scit.wlv.ac.uk/vhfc/iaru.r1.vhfm.4e/index.html>, which seems  
to be quite up to date, including the micro-locator. The only thing  
that is missing, as far as I can tell, is that in IARU Region meeting  
this September in Lillehammer, Norway, it was agreed that the WGS-84  
coordinate system should be used when determining the locator. WGS-84  
is used on the GPS-system and the difference can be up to a few  
hundred meters from some national grid frames. But fortunately, this  
is of no consequence to the APRS message structures.

Following the links, the relevant part is

>2.Description of the Locator system

>  
> The Locator system is a grid system, allowing to give the location of a  
station by a code  
> consisting of six characters, viz. two capital letters, a two-digit number  
and, again, two  
> capital letters. For example : J031DG.

Thus, all the references to the J091sx example in the APRS  
specification is wrong, it should be J091SX.

Then there is the question of micro-locators eg. J091SX23, should this  
be allowed in APRS messages ?

I think it should be stated in the APRS specification that the locator  
should always be generated and transmitted/forwarded as upper case,  
but if lower case characters are received, they should be converted to  
upper case before any further processing.

In this way if some existing system generate locators in lower case,  
the data will still be understood and this non-standard practice will

sooner or later fade away.

I would sincerely disagree with the use of the term "callsign" for the description of the contents of the destination field (page 13 and following).

A callsign is something assigned to an individual ham operator. These are not. The use of this term in the context of a UI destination field is, at the very least, confusing. When the term "callsign" is used without the modifier "destination address", it is often unclear WHICH callsign (operator's callsign or the destination address callsign) is being referenced. If the modifier has to be used to make it clear, then just refer to it as "destination address" and forget the callsign.

A much better term would be "network" or "net". It is far more descriptive of the function. There are probably other, maybe even more appropriate terms.

On page 14 of the draft spec, in the section titled:

Generic APRS Callsigns with Symbols

It says:

APRS uses several of the above-listed generic callsigns in a special way to specify not only a callsign but also a display symbol:

GPSxyx Raw GPS NMEA packets  
GPSCnn Raw GPS NMEA packets  
GPSEnn Raw GPS NMEA packets  
SPCxyz Raw GPS NMEA packets (special event)  
SYMxyz (to be decided)

Notwithstanding the "non-explanation" on page 75, it is totally unclear what function the "GPSCnn" and "GPSEnn" callsigns (a term I use under protest) might have. Given the existence of GPSxyx (spelling error?), aren't these redundant? They certainly do complicate decoding!

Hello all,

this is my comment for the APRSSPEC:

ERROR: Closing Flag is 1 byte wide

Ref.: APRSSPEC 1.0.1g, pg. 12:

The frame showing the number of bytes within an AX.25 frame shows the closing flag with two bytes, its correct only one byte.

SUGGESTION: UTC time and SI-units should be used, I agree to OH3LWR

Ref.: all units and time formats in the document

OMMISSION: Power level must have wider range

Ref.: APRSSPEC 1.0.1g, pg. 64:

Just a maximum of 810watts is too less. How should one report  $\sqrt{4000/10}$ . Please expand!

Maybe it makes even more sense to state ERP there, not power, because ERP is that what is interesting...

One more comment to general will follow in a separate mail.

hello all,

sorry if that was discussed earlier or elsewhere, I am not that up-to-date with APRS, but very interested:

Here in central europe we have a wide network of nodes and digipeaters which are mostly using FlexNet or other network systems. Standard digipeating is of course still supported, but it became very unusal.

Most conversation is done using converse nodes, such as WWCONVERSE which is supported by internet gateways, but there is another CONVERSE system based only on AX.25 networks. Both are about equal in their features.

I often thought that the best possibility for APRS to distribute the informtion wide and safe would be that the stations are all using one converse channel. By that, all constraints you are doing for networking in the protocol, it is all already done.

Let me explain it in an example: We have a VHF discussion channel on the WWCONVERSE (ch.14345). During the leonides meteor shower over 100 radio amateurs joined and were available for all comments.

If such could be done for APRS message distribution, it would gain much because the range even all over the world (remember, its called WW-converse) would be available.

Not at least, we would change from an UI distribution to AX.25 acknowledged distribution, where the packets will become as short as possible, local

acknowledged. The only thing we have to add then is a way of setting up the connection to the converse node. We should not talk about handover or such else, even when possible from the protocol, we have to deal with a wide variety of radios which could not be brought into a common behavior, I doubt.

How about such?

vy 73, Guenter, DL4MEA

It would appear that the draft spec does not permit gridsquare as a valid Destination Address data type. Is this correct?

Thanks

EXACTLY. You of course speak of the ping-pong convers server and  
its descendents.

> Let me explain it in an example: We have a VHF discussion channel on the  
> WWCONVERSE (ch.14345). During the leonides meteor shower over 100 radio  
> amateurs joined and were available for all comments.

"The Digital VHF net"? How about channel 10151 for the APRS feed?

> If such could be done for APRS message distribution, it would gain much  
> because the range even all over the world (remember, its called WW-converse)  
> would be available.

In fact, some of us "outsiders" have tried this already with position reports. It  
works. One of the big advantages of this is the system is distributed and  
if one node goes down, the whole APRS world is not brought to its knees  
as compared to the present proprietary system. Plus its a open software model  
meaning development is typically faster.

>  
> Not at least, we would change from an UI distribution to AX.25 acknowledged

I'm not sure the convers mode is the best for a RF network however.... certainly  
for the internet protocol server (APRSSERVE). However, since the code is  
available for the convers node, it could be modified to support a broadcast

mode.

>

> How about such?

I think your best bet among existing GUI authors might be to talk with Roger Barker the author of UI View. I can't speak for him, but in my conversations with him he always seemed most interested in doing things the "right way" as opposed to the way everyone else does things.

73

Jeff wb8wka

P.S. For those interested in what a convers server looks like type the following into your telnet program:

telnet 44.102.16.21 3600

Let me put it this way, I would have very strongly objected the use of non-SI units and lack of support for any other language than English \_if\_ version 1.0 had been a specification for a new, non-existent system. However, since APRS 1.0 specs is only documenting existing practice, so we have to work around existing problems and postpone improvements to the next version of the specification.

One would hope that version 2.0 would contain alternative syntaxes for SI units. For instance in the METAR aviation weather telegram it is possible to use both units. For instance Helsinki, Finland reports now EFHK 36010KT (360 degrees, 10 knots) while St. Petersburg, Russia reports ULLI 21004MPS (210 degrees, 4 m/s). In this way, there will not be any cumulative conversion errors, since the only conversion is done by the software displaying the data in any user selectable format. I was a bit surprised that APRS uses miles/h to report wind and not knots, thus there is going to be quite large errors when converting wind data from METAR to APRS.

You are absolutely correct.. The CURRENT document, (1.0) was specifically to document the CURRENT protocol so we had a solid starting point to enable changes and improvements as we go on...

One of the things we are working on within WinAPRS/MacAPRS/X-APRS is the ability to display different units. We have some of this workign already, and need to get it working more consistently throughout the program.

Since, in general, the actual packets are not looked at by humans, it  
doesn't matter what the units are. They can be converted and displayed in  
any units a programmer wants. All that matters is that everyone agree on  
what the units are. That is the purpose of the spec.

At this point, changing the units in version 2 would result in a (likely  
temporary) worsening of the situation, since a change like this would  
effectively double the number of packets a program must parse. If and  
when the subject comes up in the future, I will argue strongly against  
making such a change...

Re: Draft Version 1.0.1g (12/03/99)

Page 53 - STORM DATA

The format of the chart appears to be incorrect based on the format described in WX.TXT of WB4APR's APRSdos. I know the WX.TXT format works as I've used it for 7 years to report the storms.

Is page 53 in error or is the format being changed?

The WX.TXT format is:

CSE/SPD/HC/www^GGG/ppp>RRR&rrr

The New SPEC shows:

CSE/SPD/HC/www^ggg>RRR&rrr/ppp

Point: The RADIUS indicators and the PRESSURE indicator are reversed...

This is a great piece of documentation!

Thanks for listening es good luck.

1. I am in favor of changing the B.A.S.I.C. examples to real math symbols.

Discussion:

When I see SQR I think square, but in this case it really means sqrt(). Also there is some exponential's that are confusing. On page 33 for example there is a  $1.08 \times 10^{-1}$ . Further examples verify that it uses normal precedence, but use of parenthesis could make the math clear without examples. Real math symbology would be in line with the goals specified (to not be "dry as dust").

It's not obvious in the description of WIDEn-N on page 11 that n and N should initially be the same. That the first n is used to determine the packet time to live (TTL).

All authors agreed to drop that existing method as being obsolete. it is cumbersome to implement, sinc it is placing data in the Destination address field. Requires KISS mode to do it effectively, and also the Kenwood radios would ignore the packet. THus we came up with the gird-in-status format that can be received backwards compatible to all systems...

True. Historically, formats needed to be human readable back 8 years ago to give APRS backwards compatibility with people running conventional packet without APRS software. But we stuck with those formats since these days the users always uses APRS software on receipt, and that software can do any needed conversions to what ever the user desires. There is no need to encumber the on air format with multiple units, but I do agree in the posting that the standard conversion factors be included in the spec...

Actually, I guess the final -N is the TTL, and the initial n is just a  
record copy so that when it arrives, you know what it was when it  
started... Thus you know the number of hops...

>what the units are. That is the purpose of the spec.  
>

That's correct. The spec covers the \*ON-AIR\* data formats, not the  
application display formats. It's up to the application to perform the  
necessary units conversions to suit the user's preferences.

BTW, somebody said there might be inaccuracies in converting between one  
set of units and another. In fact, the conversions can be made as  
accurate or as inaccurate as you like -- that's an application issue.  
Much more important is to realize that the original data may itself be  
very inaccurate (for example, there may easily be a 10% error in some  
weather station readings, so there's no point in worrying about a 1%  
error in units conversion). [1]

It's true that there is a crazy mixup of units in the protocol, arising

mostly from different data sources generating outputs in different units (and partly for no apparent good reason at all). It doesn't look pretty in some places, but we're stuck with it in the \*ON-AIR\* protocol. There would be one heck of a backward compatibility problem if we changed the on-air formats now.

[1] This reminds me of the situation in England several years ago, when the government of the day threatened to metricate everything. Enterprising roadsign manufacturers started producing dual-standard signs, showing something like a (very approximate) distance of 1 mile, together with the (very accurate) metric equivalent of 1.60953 km ..... They didn't last long.

This is only true as long as the transfer encoding has more precision  
than the display format. In this way the displayed data can be rounded  
properly and in most cases the last digit is displayed correctly.

Thus feet is a usable encoding if the (source and) display format is  
in feet or meters (but not if the display unit is 0.1 m).

However mile is not a good transfer encoding if the (source and)  
display format is either miles or kilometers, in this case kilometer  
would be a better encoding. If you insist on using imperial units,  
then the transfer encoding should be in 1/2 miles (whatever that is  
called, but most likely that also has a name :-).

No matter what the transfer encoding is, the goal should be that the  
displayed value is identical in all places and displayable with  
comparable resolution as the data source.

Please, I don't mean to come off as argumentative, but I was under the impression that the APRSspec was intended to document what is \*presently\* supported, not what is agreed to for the future. As such the "Grid-in-T0" format should be there.

To be fair, I haven't fully read through the spec document, so I may be commenting out of context (is "Grid in Destination Field" the same as "Grid in To"?). Even so, version 1.0 should, according to the charter of the APRSspec activity, document what exists now, rather than what today's authors have agreed to for the future.

Well, you make a good point, but putting in a format that is obsolete, and incompatible with the largest segment of APRS (Thousands of THD7's, that is larger than all registered copies of all versions of APRS combined), did not seem to make sense. We did not want to encourage continued use of such a format... But maybe we should have put it in and marked it as obsolete...

Bob

>

The authors had previously discussed and agreed that this format was  
obsolete and was to be phased out. The user-defined format, and the  
base-91 format are other example of things which were not used or  
documented previously, but which had been agreed to by the authors prior  
to the formation of the APRSWG.

I think rather than "what is currently supported", "what is currently  
accepted" would be a more accurate description of the document...

So, base-91 is not currently a widely implemented feature.

I did not find a motivation in the document why such an obscure encoding was invented, so could some please explain the motivation behind it.

The base-91 encoding is clearly not intended for direct consumption, so if your aim is to reduce the transmitted AX.25 frame length, why not go directly to binary representation, in which you can represent 256 different values in a single byte or 65536 different values can be used with two bytes.

The AX.25 protocol allows all 256 values in an octet, so there should be no need for such things as base-91. I know, there are bad implementations that strips the most significant byte or use some bit combinations for flow control or mode switching.

IMHO, it is a scandalous that the packet network is not 8 bit transparent in 1999. Designing all new protocols in this limitation in mind, will result that there is no motivation for updating equipment to be 8 bit clean. If some popular application will require 8 bit transparent transfer that will motivate upgrading systems.

In this case there is a well established non-compressed format, so this transition from non-compressed 7 bit human readable format to 8 bit transparent compressed format can be done in each area when there is a sufficient number of equipment supporting the compressed format.

As a final result, the packet network will be 8 bit transparent, which will also benefit other applications.

A similar example is the internet e-mail, which in the rest of the world has been 8 bit clean for years, only sites in UK and the US did not want to upgrade. Fortunately the sendmail application was full of security holes, so all sites had to upgrade to newer versions that as a byproduct were 8 bit clean :-).

No, but it has been implemented in the new Kenwood D700, which makes it "cast in stone" as far as we are concerned.

So you answered your own question. 91 characters are the most contiguous  
values that are guaranteed to be passed through all TNCs.

The trouble is hams are cheap. Many will leave the hobby before they will  
spend real cash. There are too few hams already, we want to do everything  
we can to encourage people to use APRS. APRS is designed to be used with  
older equipment, because many hams have old TNCs laying around their  
house, they can dust them off and get on the air.

So be scandalized, but maintaining compatibility with as much equipment  
and software as possible is a guiding principle of APRS.

This is reasonable. APRS-NG can set a goal of SI double precision,  
but you will have to learn French, and use kilometres :-)

>behind it.

Base 91 is a neat trick to ensure that on-air characters are printable ASCII. In the same way as base 10 encompasses the number range 0-9, base 91 encompasses the number range 0-90. If you then add 33 to any base 91 value, you get an ASCII character in the range 33 ("!") to 123 ("{"). This stops just short of "|", which may upset a TNC.

NOTE:

This message *\*only\** covers future extensions to APRS. I am not criticizing the fine editorial work done on the PDF APRS draft 1.0 or its stated intent. (well, I have a few minor issues, but I'll save those for another day)

I'm writing this because I am concerned that good ideas are being dismissed offhand, or in some cases, apparently not even being considered by the WG. I feel this is wrong and goes against the amateur goal of technical achievement.

We need to make something clear here. IT IS THE WORKING GROUP's GUIDING PRINCIPLE. I don't think all U.S. hams that use APRS/AAVL technology should take a bum rap for this. European packet radio technology, for the most part, is now far ahead of U.S. technology. The fact that we are getting these types of comments from non-U.S. hams (bit efficiency, SI units, WWconvers nodes, etc.) shows there is a WIDE WORLD out there that knows the issues. The WG would be well advised to consider some of these things. These people know what they are talking about.

And by the way, the majority of hams are \*not\* cheap. Penny wise, and pound foolish, maybe.... In any case, a USED MFJ-1270 can pass 8bit data, so if someone can't afford a \$75US TNC hooked to a \$1500 computer feeding a \$300 radio, powered by their \$100 power supply, feeding \$50 of coax to a \$200 antenna, with a \$80+ APRS program, I just can't believe these "hams are cheap", they are simply foolish. The "foolish ham" might be outspoken, but clearly they are not the majority, and as such, fools shouldn't be allowed to cripple the progress of APRS/AAVL.

And oh, BTW, both WIN-APRS and UI-View support AGWPE, which lowers the cost of a 8 bit transparent TNC under \$50, or -0- if you already have a sound card in your computer. Lets not base the future of APRS on some unsound/flawed economic assumptions.

If you design for the lowest common denominator, which apparently the WG is, then that is EXACTLY what you will get. At the very least, I would ask the WG to hold the door open for these types of things in version 2. But instead, in another message, we are seeing a member of the WG telling us how they are going to vote (NO) on things that haven't even been brought up officially for version 2.0 of the draft (the SI issue). This is what is scandalous.

We were originally told by TAPR that an open APRS protocol SIG-LIST would be created for these very technical/protocol issues. Then this got changed to "APRS-SPEC", which is apparently intended only for minor/typo corrections to the draft. And now it has been learned that there is indeed an active APRS protocol list, except it is a WG members only private list not open for public participation or even observation!!

Since we are talking about the future of APRS/AAVL, and the WG is a closed organization, I feel the WG owes the entire amateur community an open mind, and to be receptive to new ideas/technologies.

Comments anyone?

Sincerely

-Jeff wb8wka

I agree with Steve's standpoint on old gear. When I do a presentation to a club or group I always address first that APRS can be run on a tnc that may go back to the early days of tnc-2. I have received email from hams that are very cheap but already have a tnc an radio that has not been touched in years. While being cheap can be a hinderance you can use it to your advantage. While packet is not a new technology, what we are appling to is is realativly new and can get some "old timers" back in the art. I have reviewed parts of the spec and find that it is a good document and I offer my thanks to everyone on the comittee. Good work guys.

I'm not going to reply to Jeff's other comments (lack of time right now,  
and perhaps knowledge as well), but this statement is flat out wrong and  
needs to be corrected.

The APRS-SPEC mailing list is indeed intended for public discussion of  
APRS protocol issues. It is being used right now as the preferred way  
to post issues about the specification document that is on the table --  
and I think most of the WG members would prefer that we focus on that  
document rather than addressing new issues -- but we have never said that  
broader discussions of the protocol are not appropriate for here.

As I know your a wordsmith, I need to ask what you mean by  
"ARPS protocol issues"? I of course was refering to the broader  
issues of APRS/.AAVL and how best to implement it. This was my  
laymans approach to it. For the sake of discussion, I will concede  
this.

I therefore stand corrected. My confussion was both the name  
"APRS-SPEC", the fact that so many were dismissed out of hand  
as well as the fact that protocol issues were being  
discussed on the private list. This all lead me to the conclusion that  
APRS-SPEC was just that..... for typo corrections of the APRS-SPEC.  
But, I am wrong as you pointed out and stand corrected.

However, this was a secondary point to my posting. I still think the WG  
as a whole needs to endeavor to keep an open mind. I hope you will  
continue to encourage them as I know you have in the past.

73

-Jeff

Future, Outside of scope of APRS version 1.0

Guy:

All kudos and backslapping aside, did you ever consider the fact that the effort to cater to the "old timers covered with dust" might be a deterrent to the future growth of the hobby? I mean, if I wanted to enter a hobby, I'd want it to be fresh, exciting and technologically advanced. I just can't see all the effort, and ultimate result being to cripple the growth of APRS.

And this whole hog-wash about 7 bit stuff is just that..... hog-wash. 8 bit codes can be run on a 1984 TNC1, let alone on any newer dusty TNC2. Its always been an artificial issue and some people just don't want to let it go.

I've been down the same road you have.... except it was for Spread Spectrum presentations. I of course was involved in the TAPR SS-STA and made many presentations at ham clubs on spread spectrum. As I said before on the SS-list, for the most part the audience's eyes would glaze over. Sure, a few would get it, but most not. As best, they would see it as just another mode. It was a struggle to get one or two seriously interested.

Now, I did do a few presentations at Linux and computer (non-ham) clubs. What a \*refreshing\* difference. These guys saw the light and could understand the new paradigm that spread spectrum could be. And in fact, almost everyone that we had in our SS group was from this Ann Arbor Linux group. Yes, a number were already hams, but they were geeks first, hams second.

I don't think we should be targeting APRS towards "old timers" (meaning technological inferiority) in particular if one of the stated goals of APRS is to

increase the number of U.S. amateur licenses. Its needs to be targeted at people that don't have licenses, that may want to get one in the future. In effect, I'm saying APRS could be a "killer app". Lets just not lobotomize it for the sake of a few dusty hams that can't spring up \$5 for a new ROM for there TNC.

Hey, maybe TAPR still has some money left in the QSY fund? We can call it the ROM fund? What cha' think?

Regards,

Jeff King wb8wka

One thing I hoped for in the opening up of APRS was for some of the talent coming on board to help us with better routing. I have always said that the GENERIC DIGIPEATING, was only a termprary way to get APRS to work with existing TNC's, but that a level 3/4 routing or even my simple SSID routing would vastly improve APRS... (Here the TO-CALL SSID is the "hop" indicator; and thus a free byte). We are currently wasting from 7 to 35 bytes in every single packet!

If some of the talent that wants to re-invent APRS were applied to improving the routing, then I think the results would be very productive indeed. All it takes is someone to write EPROM code for the popular TNC's and boy would it sweep through APRSdom....

Bob

MIM and MIC-E are in the glossary but I don't see PIC-E. Might want to include this (as it is mentioned in the text of the document).

I am VERY open to new ideas, always have been.. At the moment, I want to get some stuff finished in the CURRENT versions of WinAPRS/MacAPRS/X-APRS.. This are NOT protocol issues, but DISPLAY issues.. There are some things we don't display correctly.. And others we want to improve upon..

Also, I want a chance to make 110% sure, that our software FULLY complies to the new standard.. I also want a chance to breath and enjoy the holidays with family and friends...

I am all for new improvements etc, But, give us a little breathing room after busting our backs for 9 months..

Keith Sproul

The author's foreword states in the first paragraph, page 4:

"This reference document describes what is known as APRS protocol  
Version 1.0, and is essentially a description of how APRS operates  
today"

This statement is consistent of what I have seen on the SIG.... that is, all  
those wanting to add enhancements were deferred to the next  
version.

Now in paragraph 4, page 4 again, it states:

"It is important to realize how APRS originated, and to understand the  
design philosophy behind it."

Right, its always good to know how things originated in the past. But  
then the document goes on to say.:

"In particular, we feel strongly that APRS is, and should remain a  
light-weight tactical system -- almost anyone should be able to  
use it in temporary situations (such as emergencies or mobile work or  
weather watching) with the minimum of training and equipment"

Now, not to be picky, is this part of the spec? If so, it goes beyond  
"documenting what we have" and sets a precedent for any further  
development. I think it would be best to delete any future development  
rules and focus on just the protocol itself for now. Save that for version  
2.0

If we leave it, the statement should be re-written to say: "APRS is currently a light-weight tactical system" \*without\* going into any doctrine on how future enhancements should be made.

If we need to define future development now, then this statement needs clarification. That is, what exactly does "light weight tactical system" mean? That anyone should be able to use it? Then we need some parameters on who this "anyone" is, so that software can pass the APRS certification. The way I see it, "light-weight" will evolve over time as the software becomes smarter. If this is understood by the APRS-WG, then I have no problem with the statement as it stands.

Sorry to be anal about this, but I have some ideas for enhancements and want to make sure nothing said in this document will rule them out from future consideration.

-Jeff

This is minor, but might save some embarrassment when the document is published.

Page 4, paragraph 3 reads:

"It is not intended, however, to be a dry-as-dust, pedantic, RFC-style programming specification, to be read and understood only by the Mr Spocks of this world"

Does this add anything to the document? All it tells me is whoever wrote it has read very few RFC's. FYI, \*anyone\* can write an RFC and stand a good chance of getting it published. And I've seen RFC's that look like they have been written for the "Dear Abby" audience as well as the so called "Mr. Spock" audience.

I'd just delete this section and just say your trying to write a clear document and leave it at that. Taking a swing at those that write RFC's or are fans of "Mr. Spock" is just not required.

BTW, the APRS-WG really should consider submitting the APRS spec to the RFC process. I'm not kidding, at least on the internet side. We hams that do TCP/IP over the air have done so, I see no reason why the APRS hams should not do so.

Its there for a reason and it works (most of the time).

-Jeff

I second all the above. Good points.

I was also amused reading this paragraph. If you want to impress  
someone, at least refer to ITU-R/ITU-T (previously CCIR/CCITT)  
documents in which you really had to play Devil's Advocate in order  
to avoid all the pitfalls in the documentation :-).

A document like the APRS 1.0 specification should be easily readable  
(which it is) and should also include warnings of typical programming  
pitfalls (e.g. not using the exact conversion coefficients in unit  
conversion or the problem with upper case/lower case in locators).

Documenting what some hardware manufacturer has done is a good thing,  
but endorsing something (by not telling that this is something  
vendor specific) is quite questionable.

>The trouble is hams are cheap. Many will leave the hobby before they will

As I said in the original message, there are human readable formats  
available, so if anyone wants to broadcast a message, this can be done  
using the existing formats. However, if someone wants to transmit the  
data in only machine readable compressed form, in order to minimise  
the message length, why not simply use binary representation.

Ian,

Thanks for the explanation, the situation is as bad as I have  
feared:-).

If this vendor specific format is really going to be endorsed by including it into the APRS 1.0 specification, then this clarification is really needed in the specification, since amateur radio seems to be the only place where people still struggle with 7 bit characters.

You have this wrong. This isn't something vendor specific that Kenwood came up with. It was a format developed by and agreed to the authors. It was then given to Kenwood along with the rest of the APRS formats, and they implemented it in the new radio.

The thing is that once these protocols are implemented in a hardware device they become set in stone, or more accurately silicon! Yes, ROMS can be replaced, EEPROMS reprogrammed, but it becomes quite a task and not one undertaken lightly...

I for one see your point about 7 bit characters. There's no need to beat it to death. Just document it, and press on.

Suffice to say that a future protocol will have to use Unicode as a minimum.

I would sincerely request that the comment period be extended by a few days, at least. I see no reason to rush it, and I am barely past the description of the destination field!!

On page 19, the set of APRS-recognized destination "callsigns" (term used under duress) includes "RTCM" and "TLM". What are they used for?

The earlier recognized set included "SKYWARN". This seemed very useful. Is this now supposed to fall under "SKY\*"??

Many thanks,

Jim Wagner

Well, if anyone wants a full-blown GCC compiler for the HC11 processor  
that is in the KPC3+, go to my home page below and download the tweaks  
to gcc-2.8.1. There's also a link there to mods for the gcc-2.9.5  
compiler that a guy in France did. The gcc-2.9.5 stuff uses the  
full GNU toolset, including the GAS assembler and the GNU linker.  
All of this stuff is also searchable on "<http://freshmeat.net>".

That ought'a get someone started. Works great on Linux compiling  
things for the HC11.

I would be very interested in knowing which TNCs are not 8-bit clean and how many of them were manufactured.

My impression was that only a fairly small number of TNCs fell in this category, but I don't believe anyone has actually identified any by model.

There is a point at which the number of TNCs in this category is so small that they ought not be permitted to inhibit the evolution of amateur packet protocols.

By the way, is the rest of the APRS system 8-bit clean? I was under the impression that some APRS software couldn't handle 8-bit characters.

The nomenclature 8-bit is a little misleading, the primary problem is in getting all the values from 0 to 127. ALL TNCs, when used in unproto mode, will not accept all 7 bit codes without gymnastics. The most obvious example is ctrl-c. Sending this to a TNC will put it into command mode, not add a 03 to the data stream. Add the stream switch characters, and you end up with 91 contiguous characters. This is the primary limitation facing the use of TNCs with wider character ranges.

There is an escape character, generally ctl-v, that allows you to enter this and other restricted characters into data strings, but this adds an extra step into the process. Another answer would be to use KISS mode. My suspicion is that either of these two work-arounds would also work for 8 bit numbers, but I have no direct experience.

The internet portion does not pass non-printing characters, as became clear when the Mic-E was developed. I spent a lot of time trying to track down the origin of the problem, I think it is in the use of the telnet libraries by the clients. If I connect directly to APRSServe and send non-printing characters, and watch the outgoing data in a sniffer program, they are all present. However, javAPRS, which uses the Java socket library, seems to filter them out. There is no published interface to control the filtering. When I was working on the problem I couldn't find a good reference to the internal workings of the socket and stream classes, and in any case the other clients were having the same problem, so after spending far too much time on it I moved on.

I know this is going to raise the hackles of those people screaming kludge. However I am a pragmatist. If I can't solve a problem in a reasonable amount of time, I go around it. For me, the joy comes in making something work...

So please, no whining, or demands I fix it. At any time I'll gladly refund all the money any of you have paid me for the use of the APRServe network. If this limitation of APRServe bugs you, don't waste my time and everyone elses complaining about it, work on your own to define the problem and solve it. As I said, I wasted far too much time on this already, and I have things I find far more interesting to work on now.

Frankly, I'd be thrilled if someone would take over the entire APRServe network, it takes at least half of my free time monitoring and maintaining it now. In 2.5 years, I've gotten fewer than a hundred thank-you's, not much return for my investment of thousands of hours and thousands of dollars.

Steve K4HG

I have been experimenting with KISS and 8-bit. It appears to be no problem transmitting and receiving 8-bit. However, not all the digis in my area appear to want to digi it. Some do! It appears you can put anything in the data portion of the packet. The KISS protocol handles the control codes and binary transparently. Using 8-bit binary allows for putting more data in the same space we now use. Using Base91, gives us 6.5 bits precision. Not bad. But we could gain using the extra 1.5 bits. Example: 8 bytes, one can have Lat/Long to a couple of inches. Indeed, Garmin GPS receivers use 8 bytes to describe Lat/Long in the Garmin protocol using 2, 4-byte integers. And DeLorme encodes Lat/Long in 8 bytes also.

APRserve: First, Steve, THANK YOU, THANK YOU, THANK YOU. It is the glue that ties vastly separated areas together. It has made APRS a global community. Second: I have not understood the problem with 7 vs 8 bits with APRserve before. There is a simple way to get around this issue. Take the Mic-E example. Instead of having each client program convert the Mic-E to a "standard" APRS packet, it could just be encoded in something simple like Base64. The packet could be constructed to be transparent to APRserve. something like this:

APRSSA>BASE64:base\_64\_encoded\_data\_goes\_here.

The From callsign shows the originating station. The To callsign says the data in Base64. And the "base\_64\_encoded\_data" is the complete original packet, header/address/data complete. The client would just reverse the Base64, and send the data back through the parser. Only packets that need encoding would be encoded. Mic-E and Binary.

KISS has been out longer than APRS. KISS is available on all TNC's. It takes 8 bit chars. It will do UI mode. Numerous source code examples exist for KISS, one having just been published in the Summer99 PSR. And KISS is much more standard than the "unproto" mode on the TNC's.

So the claim that "old and dusty" TNC's can't be made to do 8 bit UI frames is false. At worst, a \$5 EPROM would need to be replaced (a 27C64 for the 1984 TNC1).

> >By the way, is the rest of the APRS system 8-bit clean? I was under

[... clipped for brevity ...]

So, what you are saying is the tools you had at your disposal for the Macintosh could not be made to pass 8 bit internet data, hence you went with what you had? Fair enough.

> So please, no whining, or demands I fix it.

Now wait one moment here. I don't see anyone asking you to do that or whining about it. What I see is people expressing concern that APRS will be limited to a 7 bit over the air format. The fact that the Mac tools may or may not have been responsible for this (legacy software) really is not the issue. We need to look forward with open minds. The very \*last\* thing we want to do is constrain and cripple our over the air format, were we need the most efficiency possible. This of course means a full 8bit compressed format.

>If this limitation of APRServe bugs you, don't waste my time and

>everyone elses complaining about it, work on your own to define the  
>problem and solve it.

I don't understand this statement. We are on the APRSSPEC list discussing future extensions to APRS. Are you suggesting that everyone go out on their own and develop independent non compliant versions of "APRS"? This would seem counterproductive to the goals of the APRS-WG.

> Frankly, I'd be thrilled if someone would take over the entire APRServe

> thousands of dollars.

If your not getting anything out of it, by all means, I'd pass it on. But I think you underestimate the amount of gratitude people have for what you have contributed to APRS. While I can't speak of the "thanks-you's" I can quote the numbers from the Spring 1999 PSR. You ran for the first time for the TAPR BOD in 1999 and captured 78.85% of the memberships vote. This was second only to Steve Bible, a long time incumbent BOD member. Assuming you wanted to be on the TAPR board, one could take overwhelming victory as a thank you. I think you should.

In any case, my interest here is that the APRS-WG consider new ideas and not hobble APRS v2.0 with any personal bias or past flawed practices. Lets keep a open mind to others ideas. And lets not assume just because that is how we always have done it is the way we should always do it.

Yes, all of that is true. But this is how we used to do things fifteen (15) years ago! Almost since the dawn of AX.25 packet radio (1984) we've also had KISS mode, which removes *\*all\** the kludges you mention. KA9Q TCP/IP has been running since the late 80s over AX.25 without any of these hangups. I just cannot understand why in 1999 so many people *\*still\** have a fixation that 7-bit ASCII terminal mode is the only way to talk to a TNC. (Or even why they even need a TNC any more).

>The internet portion does not pass non-printing characters, as became  
>clear when the Mic-E was developed.

It depends on how you pass them. The Internet has been passing 8-bit mail and news for years. Yes, you may need to convert binary to 7-bit characters, but there are dozens of ways of doing this reliably -- you don't have to invent anything new. Yes, there are limitations in telnet clients, but telnet isn't the only way to talk to the Internet.

Agreed Jeff. However, the biggest single obstruction to progress is not really personal bias or past flawed practices. It is the Kenwood TH-D7. Its "firm" ware is effectively "rock-solid-concrete" ware (I know, in theory you \*can\* get the firmware changed if you return it to depot, but how many people will actually do that?). Kenwood's commercial decision not to include flash upgradable firmware is incomprehensible.

The D7 has been a two-edged sword. On the one hand, it has ignited APRS by making it attractive to appliance operators. On the other hand, it has become a lead weight around our ankles.

The bottom line is that the APRS protocol is seriously flawed in several areas, and needs to be superseded. For efficiency and flexibility (and to get away from non-printing ASCII kludges) we probably need to go to KISS/binary, but the TH-D7 can't handle that. So the question is: do we steam ahead with a better protocol and leave the TH-D7 behind, or do we steam ahead with a better protocol on top of the existing protocol, so that TH-D7s can still work? The answer is obvious I think. However, the TH-D7 will be obsolete in a couple of years or so, so we can then progressively phase out today's kludges.

To anyone still thinking of buying a D7, don't waste your money. You'll be stuck with a dinosaur. I don't know about the D700 -- does it support flash upgrade? If not, don't buy that either. The modem vendors learned years ago that the world is changing by the day, and they were forced to support flash upgrades to survive. Kenwood has to do the same. We cannot let a feet-dragging vendor hold back the advancement of APRS.

They don't want Hams to use the radio for their own software development  
which a flash would allow.

APRS should not be based on what Kenwood implemented. That radio  
is the typical junk that Hams buy when they have more money than sense.  
I must have heard 20 people say it does 9600 perfectly with phase  
modulation, where none have been able to do it before (impossible).

>So the question is: do we steam ahead with a better protocol and leave  
>the TH-D7 behind, or do we steam ahead with a better protocol on top of  
>the existing protocol,

I think a second version of APRS should be specified for higher bit rates.  
Version 1.0 is adequate for what it is designed for. It has such a low  
cycle time, that any encoding scheme will have a minor effect.

The APRS 2.0 spec should be binary and not human readable. The cycle  
time should be on the order of 10 seconds. I picture a 2.4 GHz Spread  
Spectrum device at 300 ft with 3 Watts, and one of those Proxim  
Symphony Bridge devices on the roof of your car, using Charles Brains  
(G4GU0) vocoder board and a laptop... 440 MHz is wide open for the  
new SS rules. The band is pretty much dead in the midwest except for

repeater ID's from those who like to reserve channels, when channels is a dead concept at layer 1. When I click on a storm spotters icon, I want to hear his last voice report. That sort of capability.

In review: APRS V 2.0 should be based on a separate infrastructure that does not include Shift Keying. The TAPR SS project would be a good candidate if it could be shifted down to 440. The 900 MHz target is not usable in most of the midwest at higher power levels.

Bit rates are a physical layer issue. Nothing to do with the APRS Protocol.

>In review: APRS V 2.0 should be based on a separate infrastructure that  
>does not include Shift Keying.

Shift keying is a physical layer issue. Nothing to do with the APRS Protocol.

Nowhere in the spec is there any mention of 1200 bps or any other physical layer issues. Ditto the AX.25 spec.

By all means talk about SS and similar, but this list is not the place for it.

>Bit rates are a physical layer issue. Nothing to do with the APRS  
>Protocol.

The submission was in the context of cycle time. You can't decrease  
the cycle time without increasing the bit rate.

Will APRS always have a cycle time of 10 minutes? Even in future  
protocols? What does "...disseminating live data to everyone on a  
network in real time." really mean? (Page 7).

I will try to refrain from invoking the moderator.

No, let me clarify what I wrote. I said the Macintosh portion (the APRServe program itself) is 8 bit clean. The problem appears to be in the clients that connect to it using telnet protocol (RFC 854 provides specific functions for specific non-printing chars, so most implementations filter them rather than pass them) or other ASCII oriented protocol.

On further reflection though, it isn't 8 bit clean...even though it will pass all 256 values, 0x0d has special meaning as the end of line character. In order to pass it, you would need to go to a different means of identifying the end of the packet, such as header-length-data. It would be a complete re-write...

>

No, I don't underestimate that, and perhaps I wasn't clear in what I wrote. I know more than 100 people appreciate my work. My point was that my motivation has nothing to do with the tangible rewards of thank-yous and money. If it did, I'd have been gone long ago. My motivation is in creating something that works and is useful. Unfortunately, it is too successful ;-)...it is useful to so many people that I feel an obligation to keep it working. So instead of using my free time to work on making something new, like XMLserve, work (which is what I want to do), I'm spending it keeping something old going (been there, done that).

My real rewards have come and gone...the first time I saw javAPRS bring up live data in Atlanta, the first time we sent a message between two copies of MacAPRS via the internet, the first time we sent a coast-to-coast radio-to-radio message. That is why I did this. I see no new firsts coming from APRServe itself, which is why I want to work on XMLserve.

>In any case, my interest here is that the APRS-WG consider new ideas and  
>not hobble APRS v2.0 with any personal bias or past flawed practices. Lets

>

There are problems. Besides the need to change APRServe to handle the 0x0d character as data, all the IGates would need to be changed as well, and all the clients would need to be updated. As Brent pointed out, some digis don't pass the 8 bit data, that would need to be tracked down and fixed. All this would need to be done more-or-less all at once. Not an insurmountable task, but a daunting one, especially for a loosley-knit volunteer group.

Then there is the issue of the D7's EEPROM. For those that do not know, the D7 EEPROM can only be updated by using a special programmer and soldering wires to the circuit board. If I were designing it I would have done this differently, as I'm sure you would have. However, it exists. Any change to the protocol that affects the D7 means committing every owner to sending these devices to Kenwood for reprogramming. A major inconvenience, and probably expense, since I doubt Kenwood would consider this a warranty repair. As Bob points out, there are more of these already than all registered APRS users. How would you deal with them?

What do you really gain by going to full 8 bits from base-91? A bit and a half, give-or-take, for each byte. The base 91 format encodes the course, speed, altitude, symbol, and lat/lon in 12 characters. So you could save one byte for sure, probably 2. Sure, it would be more elegant, less kludgy, but the savings would be less than 20%, and far less in actual channel capacity when you consider the 30% optimal load and tx time. Is that worth all of this angst?

I think all of us would do things differently if we could throw out everything we have and start from scratch. If APRS were the few dozen people on the list that would be a viable option. With thousands of hams around the world using it, hundreds of digis, and thousands of difficult-to-reprogram radios, I don't feel a new start is a viable option, and I remain committed to making things work as best we can with what we have.

The specific question was whether the rest of APRS was 8bit ready now. My response addressed the Internet portion of APRS. I am well aware of the internet's handling of 8 bit characters. However, the question what worked now...

KISS and AX.25 have something like this, for its own special char (0x7F for AX.25 and I think 0xFE for KISS). They have a simple padding mechanism to represent these chars without sending them. Very little overhead and you get a full transparent 8 bit path.

> and all the clients would need to be updated.

How many releases of WINAPRS are there a year? How many releases  
a year of APRS-SA4 are there a year? UI-VIEW? I know there is a release  
of XASTIR (at least a development version) at least every week it seems.  
So until the authors chime in and say they are adverse to change, I  
will assume by the volume of updates they all put out, they are always  
open to new ideas.

I realize nothing will be overnight. The "APRS 2.0" changes  
could be integrated into the software over time, and a change/over date  
could made for all.

And since your now going to APRS-XML-Server, any APRSSERVE  
legacy issues will go away in time.

But first steps first. I was simply asking that first these technical ideas be  
considered, and then we can talk about the political issues of why people  
won't want to change. If the changes make no sense technically, then  
its pointless to discuss political reasons why people won't change.

> As Brent pointed out, some  
> digis don't pass the 8 bit data, that would need to be tracked down and  
> fixed.

As I pointed out to Brent in a private message, I've used KISS since about  
1986, exclusively (except for APRS) and I have never seen this problem.  
KISS is used with NOS, FBB, MSYS, BPQ, W0RLI and many other  
applications. If there was a problem, I think we might have heard of it.  
I'm not at all saying Brent is wrong, I'm just saying a little more  
investigation need be carried out before it becomes a quotable fact/  
conclusion KISS won't work on all digi's. I doubt this is a issue as  
KISS is a worldwide standard (well, actually, it has evolved somewhat  
outside of the US.... 6pack and SMACK being two varients... but  
they are all are compatible over the air)

Now before we get into the Kenwood D7 issue, a question needs to be  
answered. It is:

Is anyone on the APRS-WG under a contractual agreement with Kenwood?

I think in any discussion of Kenwood/APRS, pro or con, needs to be made in the context of full disclosure and knowing who might be beholding to who.

> Then there is the issue of the D7's EEPROM. For those that do not know,  
> the D7 EEPROM can only be updated by using a special programmer and

Yeah, I guess you can't expect hams to know how to solder...but I bet the 15 year old hacker down the street knows how to solder. In either case, if the ham can't solder, many people could do it for him/her for \$\$

On the programmer, I think you underestimate ham/hacker ingenuity. I just finished building a "RIB", which is the Motorola programmer for their FLASH based commercial radios. I'm sure they hold that as close to heart, but schematics are posted all over the internet.

> already than all registered APRS users. How would you deal with them?

Good issues. But I question if the WG should even consider these. First of all, if anyone on the WG is under a contractual agreement with Kenwood, this had poisoned the well already, so to speak. And the more basic issue of should Kenwood drive the future of APRS, just because they made a bad business decision, needs to be addressed. And if so, I think the WG needs to give every manufacturer a vote on the WG. Maybe ICON has a different way than Kenwood. But a better solution is to just completely negate any outside commercial interests.

I also think you underestimate Kenwood. If there was a compelling business reason to update the firmware (like upset owners wanting new features) then they would find a way to do it. I was told by Bob that the Kenwood is a flash based radio, so it should be possible if the will exists. Quite frankly, I think Kenwood would be open to changes as it would insure them of a continued revenue stream from D7 owners needed to update the firmware. Kantronics certainly knows about this.

Look ahead, look ahead... we are not talking 20% savings but 50% or more savings of total air time. With those extra bits, you can rearrange things to make more sense and pack the bits a little better. And there really is no compelling reason

even to stay with AX.25. AX.25 is a connected mode protocol poorly suited for broadcast applications. How do you do FEC on it? (you can't) So, sure, if your assuming APRS is always married to AX.25, your argument makes some sense. But what I (and I think others are suggesting) is to optimize the existing protocol (which *will* still work under AX.25) and then we also have a protocol that makes sense for other more advanced transport methods. And yes, a \$59 PIC-E can do FEC (with a Ramtron chip).

> what we have.

I've been in packet radio since 1984. I've seen numerous *major* changes, like from AX.25 level 1.0 to AX.25 level 2.0. Changes in the BBS forwarding protocols. Complete rewrites/new protocols in KA9Q NOS. All these changes affected more people then are on APRS. We all survived and thrived. It does need to made clear that no-one is suggesting change for the sake of change. But if something makes some sense, I would ask that the APRS-WG consider it with an open mind.

It is premature for you to dismiss these ideas as you appear to be doing. We are not even at the "APRS 2.0" stage. On one hand it is suggested people present new ideas, but on the other you basically tell us how you will vote on them (no). Why would anyone waste their time writing an extension for APRS 2.0 when they know it will never be incorporated by the APRS-WG?

I don't think anyone here is suggesting we throw out APRS version 1.0 as you may fear. But I do think that APRS needs to be able to evolve in a orderly fashion. And staying with all the legacy decisions that we made when APRS was first created will not allow this evolution.

XMLServe does not replace APRServe, they have very different functions.  
See <http://www.aprs.net/xml/dcc99.html> for my DCC paper about it.

OK, but I got the following on 10/14/99 from another member of the WG:

>I think in Steve Dimse's mind there are two practical reasons why he doesn't  
>want to formally document APRServ now. First, he's on vacation and will be  
>travelling until, I think, nearly the end of the month. It's a pretty-

>the DCC. Second, I think he views APRServ as a dead-end, and views the new  
>XML approach as its replacement. Therefore, it makes sense in his mind for  
>any documentation effort to focus on that as the going-forward protocol.

So, as you can see, even a member of the WG made the same mistake as I that  
APRServe would be going away after time.

Sorry.

-Jeff

Hi Jim --

I understand your desire for a longer review period, and I've passed  
your request on to the Working Group.

John

User-loadable firmware does not necessarily imply user-programmability.

The TH-D7 could easily be built to accept firmware only if it was

digitally (cryptographically) signed by Kenwood. I will write up an extended version of my earlier e-mail on this topic and send it to Kenwood, (but not until after this week's program review.) (I probably won't read the spec until then either...)

On page 83, the reference to "Object Report Format - with Lat/Long position",  
two format symbols are specified. I cannot tell whether the second is "-"  
or "\_". Please clarify!

A bit further down on the same page, "Item Report Format - with Lat/Long  
position" suggests that item name is variable length. This seems a bit  
strange since object names are fixed length padded with spaces. Why not  
more consistency?

Many thanks...

Jim Wagner

On page 83, in the "Weather Report Format - with Lat/Long position", it is NOT obvious to me how one distinguishes weather report from other formats using the same symbols (!=/@).

Many thanks, again,

Jim Wagner

Hello, I'm relatively new on APRS and I've some questione about the rule of a digipeater installed to serve a wide area (in my case it is installed on a hill).

Actually I have a TNC2 digipeater that perform simple repetition of the packet with the broadcast path set to RELAY WIDE, but I want to understand the rule for call substitution.

Here's the questions:

What is the general rule for call substitution on a WIDE digipeater ?

A digipeater make call substitution on RELAY?  
A digipeater make call substitution on WIDE?  
A digipeater make call substitution on TRACE?  
A digipeater make call substitution on SS?

What path a digipeater use to send its beacon (none or RELAY, WIDE, or WIDE WIDE, or what) and what is its destination? (In my case I'm using a TNC2 with my own code do I need to use APZxxx?)

A digipeater reply to "?APRS?" (or other) query?

And if yes it use the default unproto path or none?

I don't have linux at my home and there is no aprsdigi in my area so I cannot try how aprsdigi perform the repetition of APRS frames.

I've tried to understand form the documentation but I'm not sure, so here there is 3 pratical questions.

Case 1: RELAY, WIDE frame digipeated from 2 WIDE digipeater

A frame like this:

IW3FQG>APRS v RELAY, WIDE

will be repeated from the first digi:

IW3FQG>APRS v RELAY\*, WIDE

and then the second make the call substitution:

IW3FQG>APRS v RELAY, DIGI\*

Is it correct?

Case 2: RELAY, WIDE1-1 frame digipeated from 2 WIDE digipeater

A frame like this:

IW3FQG>APRS v RELAY,WIDE1-1

will be repeated from the first digi:

IW3FQG>APRS v RELAY\*, WIDE1-1

and then from the second digi:

IW3FQG>APRS v RELAY\*, WIDE1-0

then the third make the call substitution:

IW3FQG>APRS v RELAY, WIDE1-0\*

Is it correct?

Case 3: RELAY, TRACE1-1 frame digipeated from 2 WIDE digipeater

A frame like this:

IW3FQG>APRS v RELAY,TRACE1-1

will be repeated from the first digi:

IW3FQG>APRS v RELAY\*, TRACE1-1

and then from the second digi:

IW3FQG>APRS v RELAY, DIGI1\*, TRACE1-0

and then from the third digi:

IW3FQG>APRS v RELAY, DIGI1, DIGI2\*

Is it correct?

I've read the protocol spec draft 1.0g but I never see a practical example like for other arguments in the specs.

Thank you in advance for the reply.

Marco IW3FQG

You mean on page 45? The yellow highlight, gray printing works for me,  
as it shows it to be a dash. Without the highlight it would be a  
problem though.

Things stand out when you document them :-)

It is not vendor specific. It was developed by the authors  
back in the summer of 1998 before it was implemented by Kenwood. The

objectives were, short, printable, and resolution to DGPS accuracy...

Bob

Carefull...

With the demise of amateur radio, the death of Amateur Manufacturers by  
the droves, in the few years you are predicting a dinosaur, the only  
thing you will be able to buy will be the latest cell-phone and personal  
digital assistant that everyone else on the planet is buying.. AMateur  
radio willlll not exist at any price... unless you build it yourself.

Deciding what is "best" for the protocol is NOT just a technical issue...

And of course, by then we will all be pirates, since they also sold our  
spectrum too...

It is consistent with our .POS files which define all OVERLAY objects on  
maps. Unfortunately, since these files are "not on-air-protocol", you won't  
see the "consistency"... :-)

These "timeless" objects and "items" don't need the time field and so the  
format is different from OBJECTS transmitted over the air...

By the Symbol Type. The above "type" characters distinguish the "types"  
of position reports. But ANY position report or OBJECT that uses the  
WEATHER symbols can contain WX data. Those are the Primary and secondary  
/\_,\\_ and /W, \W symbols...

Bob:

I think Paul had good reason to be confused. Today you stated that the spec was developed outside of the influence of the vendor where as on Dec1 you said the vendor imposed a deadline for the spec on the authors. Are these one in the same or are we talking two different things here?

-Jeff

(also see second attachment below)

On Mon, 13 Dec 1999, Jim Wagner wrote:

On page 83, in the "Weather Report Format - with Lat/Long position", it is NOT obvious to me how one distinguishes weather report from other formats using the same symbols (!=/@).

Bob Bruninga answered:

By the Symbol Type. The above "type" characters distinguish the "types" of position reports. But ANY position report or OBJECT that uses the WEATHER symbols can contain WX data. Those are the Primary and secondary /\_, \\_ and /W, \W symbols...

Jim Wagner adds the following comment:

With all due respect, I think this is one of the worst possible ways to specify a format. You have to get much of the way through the packet before you find out what it is (you have to read the second symbol character before you can be certain). Weather position SHOULD HAVE ITS OWN DATA TYPE CHARACTER(S).

To make matters worse, I could not find the above condition described Bob Bruninga anywhere in the spec. It may be there somewhere, but, if it is, its very well hidden.

On page 22, "+" is identified as "Shelter Data with time". Yet, this data type is absent from any subsequent data type descriptions. Either, the data type description should be added or the identifier should be removed from the table.

Greetings -

While perusing the current draft of the spec, I came across the following dilemma:

I cannot find out what the symbol is for "current Mic-E data", the one in the right-hand column of the table on Page 16 (identified as page 22 of 99 by Acrobat) just above "a-z".

When I select this character and paste it into the Find dialog, it also finds the same character on Page 39 (Acrobat's 45 of 99). But, IT DOES NOT FIND SAID CHARACTER IN THE ASCII TABLE.

What character is this?????

Many thanks,

Jim Wagner

Hello -

On page 17 (acrobat's 23 of 99), it says:

Note: There is one exception to the requirement for the Data Type Identifier to be the first character in the Information field - this is the Position without Timestamp (indicated by the ! Data Type Identifier). The ! character may occur anywhere up to and including the 40th character position in the Information field. This variability is required to support X1J TNC digipeaters which have a string of unmodifiable text at the beginning of the field.

Could someone please supply an example of the text resulting from this situation?

Many thanks,

Jim Wagner

It's called a grave accent. It's a very common symbol in Unix (usually  
found just above the tab key). ASCII code 96.

> I cannot find out what the symbol is for "current Mic-E data", the one in  
> the right-hand column of the table on Page 16 (identified as page 22 of 99  
> by Acrobat) just above "a-z".

The page numbers are located at the top of each page. You probably  
mean page 16. The acrobat page number is worthless.

(I hope this doesn't repeat comments that have already been made, but I only found the time to start reading the spec yesterday.)

Some aspects of the spec appear to me to be based more on commercial considerations than on what is really desirable in a protocol specification. Surely a basic goal of a spec of this type should be to make it platform and product independent?

First, there is a list of destination addresses that serve little purpose other than software/hardware product advertising:-

>The following software version types are reserved (xx and xxx indicate  
>a version number):  
>APCxxx APRS/CE, Windows CE  
>APExxx PIC-Encoder  
>APIxxx Icom radios (future)  
>APICxx ICQ messaging  
>APKxxx Kenwood radios  
>APMxxx MacAPRS  
>APPxxx pocketAPRS  
>APRxxx APRSdos  
>APRS older versions of APRSdos  
>APRSM older versions of MacAPRS  
>APRSW older versions of WinAPRS  
>APSxxx APRS+SA  
>APWxxx WinAPRS  
>APXxxx X-APRS  
>APYxxx Yaesu radios (future)  
>APZxxx Experimental

(That lot is roughly the equivalent of the authors of the AX25 spec having included a facility to specify in each frame the type of TNC being used!)

Second, there are the frequent references to Kenwood radios, even to the extent of including their type numbers. Is the working group going to update the spec every time Kenwood produce a new radio?

I would make two suggestions:-

1. Either -

(a) Only destination addresses that contain \*protocol\* information should be allowed. Or

(b) Any destination address should be acceptable. I.e. no APRS software should default to discarding frames because the destination address is not one of those listed in the spec. This makes little difference, other than removing a filter that is logically unnecessary, and which introduces a bias against new software/hardware products. Destination addresses that contain protocol information will be treated exactly as they are now, but, for instance, ABC326 will be just as acceptable (and, from the point of view of the protocol information it contains, just as useless) as APM326.

2. The members of the working group need to have a good, hard think about the desirability of including in the spec references to specific items of equipment from one manufacturer. One thing for sure is that the rest of us are always going to be wondering exactly why they did it. The TH-D7 is a great radio, but that isn't a valid reason for including references to it in a protocol specification.

I noticed the reference to a Kenwood TM-D700 radio. I never heard of it, so I reached for my AES catalog, and found an Ad for it on page 72 (Winter 1999-2000).

It advertises that it has advanced APRS-99 features.

- 1) What is APRS-99?
- 2) Does that mean it can decode TAPR equipment?
- 3) Should the spec be changed to APRS-99 instead of 1.0?

73,  
Steve, K50KC

Hi Roger --

Thanks for your comments. I don't want to address substantive questions about the protocol (I'll leave that to those more knowledgeable), but your

message gives me a opportunity to reiterate something for those who are just joining the discussion:

The goal of version 1.0 of the APRS Protocol Specification is to document the APRS on-air protocols as they are currently used. That means that we're documenting some things that are, shall we say, suboptimal. There are things that could -- and perhaps should -- be changed, but the WG made a conscious decision not to address any changes to the protocol in the version 1.0 document, which is intended to provide a baseline of where we are today. Those discussions will happen after version 1.0 is locked down; we'll have an ongoing process in place to handle requests for protocol changes submitted by the public.

While I've got the floor, I'll also note that folks have pointed out that version 1.0 does, in fact, make a couple of changes to the existing protocols -- mainly, by not including a few deprecated constructs. Based on the feedback we've received, we'll review those decisions and try to come up with a way to document those aspects without perpetuating them.

Thanks,

John N8UR (jra@febo.com)  
Administrative Chair, APRS Working Group

>changes submitted by the public.

I did, of course, understand that. Therefore I limited my comments to aspects of the document that do not have any protocol content. As I pointed out, the destination addresses that are used essentially for product advertising contain no protocol information, nor do the references to specific Kenwood radios.

Since V1.0 will obviously form the basis for future changes, my question is quite simple - Given that these aspects of APRS operation have no protocol content, should they be in a \*protocol\* specification? If the answer is yes, then obviously someone will be able to explain exactly what protocol information they contain that I am missing.

To repeat what I said in my first message - Surely a basic goal of a spec of this type should be to make it platform and product independent?

Folks:

[I joined 24 hours ago and have been monitoring for a bit, so I don't know if this issue has been addressed already]

I'm working with Steve Bible and a good crew on a stand-alone weather station we hope to have out (very) late this year or early next year. As such I'm paying close attention to the weather chapter and am confused about how to identify my station.

The issue: I send out the weather data per the format starting on page 50, but don't know how to identify my weather station type (APRS Software Type Field) as the only options are things like DOS, Windows, etc. I'm "none of the above" as I'm running from a dedicated microcontroller. Can another option get added for "other" or (ideally from my point of view) an option for "embedded". Even with the latter, an "other" would probably still be a good idea.

I currently send out an identifier of "e1w" for "embedded, 1-wire", but can change that very quickly if there is a better format. When Denver had an igate and my data got out, this identifier worked for all the APRS programs except WinAPRS which interpreted this as one inch of rain. Since the goal is backwards compatibility, I expect to have to change my identifier, I'm not sure to what though.

will

PS: I've worked on specs before, it is a grueling task. My hats off to you!

One is the Apostrophe and the other is the grave accent. "'" and "`".  
Id have to look it up to see which one is for Current data and which one  
is for OLD data...

The vendor imposed no such deadline. But we certainly knew when was the last opportunity to influence what they would implement and what they wouldnt implement as they went to production.

It would have been stupid not to be aware of such relevant things going on around us...

Anything starting with an "AP" is valid. The filter for other non listed  
destinations is essential for the ALT-NET concept to work. Please look  
carefully at that section. We must have a way of using the APRS

Infrastructure for sub-nets without cluttering every single map on frequency...

That seems to fit nicely with the APExxx bunch.

That list was not meant to be exclusive, but just to give an idea of which ones are already in use...

By definition the PALM version would not be fully 1.0 compliant if it could not handle to number of characters in a message specified in the protocol definition.

Remember this protocol is suppose to be a specification from which all APRS clients are measured. We can't have moving goal posts and we can't allow clients to fudge with the specs. The end user should not have to worry about wether or not person on the other end can read more than 40 characters. It would be best to have the PALM version handle the SAME size messages as everybody else.

It would be easier for the PALM programmer to correct the short comings of his program, then to have the rest of the community be burdened by it. The PALM programmer should be forced to comply with the protocol, rather than the other way around.

73,  
Bill

Before I launch into my comment I would like to congratulate the APRS WG for the overall excellence of this draft (1.0.1g) of the APRS specification. I would say it is very "professional", but I've dealt with specifications written by professional engineers that are not as complete or coherently put together. The quality and effort involved in this document is apparent. Thank you very much!

[UNCLEAR]

Page 27, section entitled "Bearings and Number/Range/Quality"

I am reading this section with interest, since I am one of the developers of the MicroFinder doppler (mentioned in page 16, APRS Data Type Identifier).

The unclear part for me is where the numbers N, R, and Q are derived from.

"N" seems to be some sort of pseudo statistical value, but doesn't indicate what the source of the information is. Does this come from the sending APRS program or the external device (AKA doppler). If the value is to come from the APRS program, the description included in this text is probably not clear enough to produce a consistently reliable implementation from different implementers. If this value is supposed to come from the external device, it sounds like it might be too device dependent (I know of several doppler based systems that do not do anything like this).

The range looks like it is generated by a compliant APRS application... correct?

The output of our doppler unit provides a single number which we call "quality". Is this supposed to be the "quality" value supplied by the doppler (normalized to 0-9) or from some other source?

m/j/a

Roger:

I can't answer your question, but I asked a similar one myself that never  
got a coherent response. The lack of a response or even the act of  
obfuscation itself can be an answer.

If APRS is truly meant to be a hardware independent protocol, then we should stop identifying different variations of the protocol by its originating piece of hardware or software. I believe we should mainly identify the protocol by its version number. Instead of using APM326 to stand for "MacAPRS 3.2.6", we should use APV100 for "APRS Version 1.0.0". There should be no need to concern ourselves with what a transmitting station is running, only with the version of the APRS Protocol being transmitted.

If we used APVxxx to signify APRS protocol Version x.x.x :

It could be assumed that a APRS client running "APV101" should be able to decode "APV100". It could also be assumed that a client running "APV100", may not fully decode all data coming from a station sending "APV101". No meaningful assumptions can be made when a MacAPRS 3.2.6 ("APM326") is sending data to a WinAPRS 2.3.3 ("APW233").

In addition, I believe we should continue to use "APZxxx" to signify an experimental addition to the protocol. For example, "APZ100" could signify that the core protocol is at least compatable with "APV100" with some experimental extensions thrown in.

So if my vote counted for anything, I say ditch the other "APXxxx" and use:

"APVxxx" for APRS compliant version x.x.x

"APZxxx" for APRS beta version at least compliant to APRS x.x.x

And we should stop using the protocol specification as a registry of vendors who has licensed the term 'APRS'.

Just my two cents worth.

BTW, My appologies if I misunderstood something.

73,  
Bill

Bob:

Alas I am not using a PIC, in my case it is a Motorola 6808. I was aware of using the destination field for software versions too, and that did seem like a duplication. I was pretty much ignoring that field and concentrating on the trailer for my identifier as that seemed a lot more flexible. I think your answer complicates my original question though. You are correct that I should fix the Target field to something, I guess I'll pick an unused one such as APDAXx (DA for Dallas), so I don't chew up all the D's. But, don't I still need to have something for the trailer to uniquely identify my particular weather station?

I have been using separate packets for position and weather. My theory was that by sending weather every 5 minutes, but position every 43 minutes, I was saving precious bandwidth. There are obvious annoyances, but they seemed worthwhile to save bandwidth. My station identifier is really short, just my callsign and uncompressed location, none of that other fluff like email addresses and stuff. If I can justify putting in the position, that would be nice.

The N7LUE Doppler system preceeded APRS, so we built it to match.  
Then we added Doppler Systems Inc, then we added DFJr parsing.  
Yes, N was somewhat driven by the N7LUE device. If it doesnt apply to  
your doppler unit, then dont use it. We do need to define the Null  
value...

> The range looks like it is generated by a compliant APRS  
> application... correct?

None currently generate it. That field is for a best guess of range "if  
available". APRSdos generates it for manual reports based on the current  
map scale. The assumption is that if a guy is using a 32 mile map scale  
to view his DF event, then he probably expects all DF bearings to be  
within 32 miles. Before we introduced that value, DF bearings could go

around the world. But, if I am doing HF DFing and am looking at the 1000 mile scale, then, the DF bearing line should be on the order of 1000 miles long...

This brings up the very important APRS concept of "MAP RANGE". I will address this in a different Epistel...

One serious omission from the SPEC is the concept of RANGE SCALE. Although it is not an "ON-AIR" issue, it is fundamental to all tactical display systems and APRS.

Two people viewing the same tactical display centered on the same LAT/LONG can not see the same tactical picture AT ALL, unless they are viewing the area to the same MAP scale. A view centered on the WhiteHouse at the 2 mile scale to see the Marine Corps Marathon, will look almost 100% different to another viewer viewing Washington DC at the 64 mile scale.

I hear it ALL THE TIME. Two people looking at the "same" map and yet not seeing the same thing at all, and arguing by voice over the air that they cannot see what the other person is talking about.

The Army, The Navy, The Marine Corps, the Airforce, the FAA and APRSdos and everyone else that uses tactical displays ALWAYS refers to RANGE SCALE. This dimension is absolutely critical to exchanging information. APRS is a system of "views". There are THREE variables to a VIEW. LAT/LONG and SCALE.

In my opinion, we should use the same RANGE SCALE system used by all other tactical systems, and that is the RANGE from the center of the screen to the top or bottom. Thus If I am looking at the 64 mile RANGE SCALE, then I see all things within 64 miles of me. On a 3/4 CRT, of course, I can "also" see things as much as 100 miles from me to the east and west, but that is coincidental. The fact that if I am on the "64 mile scale" that I can see "ALL" objects within 64 miles of me is the critical concept.

In APRSdos, if you select METRIC, then these scales are shown in KM. These "views" need not be "precisely" to the edge of the map. APRSdos actually displays about 10% or more beyond the exact "64 mile" ring, but they are important to bound the "scale" of the view.

I will take a look at the spec and look for where this concept should be added. Authors have argued that this is a local display issue. I disagree. Specifying "views" for commonality in human understanding of tactical events, MUST include not only the CENTER, but also the RANGE.

8 different users of 8 different programs must be able to all see the same thing when one of them says "Go to 3859N 07629W at the 32 mile scale and tell me how many mobiles are there..."

This is far more than a local display issue....

Bob,

Sounds like a bit of explanation on those items,  
such as you added here, would be useful.

Thanks  
mike kn6zt

Here is my recommended additon to the SPEC for Range Scale:

Under the general chapter on "Design Philopsohy" add at the bottom of page 11, words to the effect of....:

MAP VIEWS: As a tactical geographical system, users of APRS need to be able to relate "map views" in a non ambiguous way. Thus, all map displays should have a meaningful legend to convey to the user, the scale of the map view. To then be able to communicate about such views, there are three coordinates required. Latitude and Longitude of the map center and Range Scale.

In this context, Range Scale is the approximate range in either Nautical miles, Miles, or Killometers from the center of the map to the top or bottom. This convention gives all software users a common basis for describing tactical map views (at whatever range scale is in use).

I hope that does not step on any toes.... But is very important for APRS.

Bob

Some more trivia to the spec:

ON page 1 where you refer to my name twice. Can I ask that my call, WB4APR also be included.

On page two where you describe the construct of the working group. can JOHN ACKERMAN please offer some legaleeze to protect us from frivolous litigation with words such as....

USE AT YOUR OWN RISK ... and cannot be held liable for the use or application of this standard or to any dameages that may result... BLAH, BLAH, BLAH...

Hello Group -

In the description of Net Cycle on page 9, it seems to overlook the following unproto path: ... VIA WIDE5-5.

To "unsmart" software, this would appear as a 1-digi path and would use the wrong Net Cycle time.

Sincerely,

Jim Wagner

Hello, group

On page 22 of the draft spec, the idea of a "Default Null Position" is offered. It suggests an appropriate format for a station that cannot determine its position as 0000.00N and 00000.00W.

Unfortunately, this is a real location on the surface of the earth. While the odds of an APRS station being there is very small, the odds are NOT zero.

The earlier paragraph about Position Ambiguity really solves that problem. This is, after all, a situation of nearly-infinite ambiguity. Thus, the format

" . N" and " . W" (that is, spaces in all position digits)

is perfectly logical. And, there is no chance of mis-interpreting it as a position.

On page 24, it is printed:

A fixed-length, 7-byte field may follow APRS position data. The field is an APRS Data Extension. The extensions may be one of the following:

- \* CSE/SPD ....
- \* DIR/SPD ...
- \* PHGphgd
- \* RNGrrrr
- \* DFSshgd
- \* Tyy/Cxx

What I read seems very contradictory and incomplete. In the quoted sentence at the very start of the section, it talks about "following position data". There are no qualifications, or limitations.

Then, a bit later, it just slips in "can be used to represent the wind direction and sustained one-minute wind speed in a Weather Report."

Is, this, in fact, the wind direction and speed field indicated in "Weather Report Format - with Lat/Long Position" on page 51? If so, that page seems rather silent on the point.

Something, please something, should be done to reduce these ambiguities!!!

For Bill C. and the Spec SIG...

Tuesday I wanted to show that there were differences between APRS  
platforms, and used a "PALM" as an example.

This was supposed to be hypothetical... but I sort of forgot that there is  
a real v1.0 of a real Palm program, PocketAPRS. I left the impression that  
this program didn't handle regular APRS messages, and that's not the case.

So... please... pardon my goof!

No problem. Maybe we should stick to using fictional programs for examples.

I'd still like to formally reserve the following version type:

APVxyz = APRS protocol version x.y.z

Who do I need to send this to in order to have it appended to the list on  
Page 20 of the "APRS Protocol Reference" ?

73,  
Bill

The problem is that this need to be converted to a number for internal representation. I doubt very many of present implementations could handle this at all. Many products out there are already using 0N 0W as the null, keep in mind that this version represents APRS as it is.

Finally, why 0N 0W is indeed a real point, it is not a very interesting one from an APRS standpoint. It is highly unlikely that anyone running APRS will ever be there, and even if they tried to anchor directly on the point, normal GPS dithering would result in only a tiny percentage of their posits actually being 0.000000N 0.000000E.

Hello,

On page 7 the spec states "APRS is a packet communication protocol ..."

However on Page 8 it states "APRS runs on most platforms,..."

Also on page 26 is states "APRS uses the p,h,g and d codes to calculate ...". Also on page 26 "The 7-byte DFSShgd Data Extension lets APRS..."  
These two Items suggest that APRS is software.

Perhaps this should be reworded as "APRS clients run on most platforms..."  
and an "APRS client might use the p,h,g and d ...".

I suggest the usage of the term "might use" as there is exists other more complicated propagation models that consider local terrain features. Or it could ignore them completely. For instance does my TD7A do these computations?

Perhaps the standard to include both the software aspects  
and the protocol aspects should more clearly separate out into part 1  
The protocol in gory detail. And Part 2 Things that software might want  
to do with the data acquired from via the APRS protocol.

Also another organization change that would be quite useful for  
discussing the standard would be to add section and subsection  
numbering. This would be useful in the days when an HTML or PDF or  
Postscript version is available and all have different paginations to  
make it easier to discuss which content we are referring to.

After this criticism of the document I feel the need to say that all the  
content I was looking for is contained in this document.

Charles Suprin

I guess I'm not clear on your planned usage of this. These codes are reserved for specific software and hardware implementations of the protocol. While the APRSWG hasn't specifically addressed the mechanics of handing these out, I suspect we will want to wait until someone has a program or device ready for on-air testing, since we have a limited number of available codes.

Clearly any device forwarding a position must handle the following things in some consistent way

07201.7\_W represents longitude to nearest 1/10th of a minute.  
07201.\_\_\_W represents longitude to nearest minute.  
0720.\_\_\_W represents longitude to nearest 10 minutes.  
072\_\_.\_\_\_W represents longitude to nearest degree.

where \_ represent the space character. It is clearly wrong to receive a position of 072\_\_.\_\_\_W and forward it as 07200.00W, so either the ASCII string must be stored and forwarded or some other means must be used the number of digits used.

>Many products out there are already using 0N 0W as the null,  
>keep in mind that this version represents APRS as it is.

What should the receiving application do with an invalid coordinate that somehow (eg. manually), has been entered into the system.

What should the application do with 9999.99N ? IMHO, this is a much better null coordinate than 0000.00N/000000.00W, which would remove any ambiguity with a real position and a null position.

At the equator one minute would represent one nautical mile in both latitude and longitude. With the full .00 precision, that would be about 19 m, which is comparable to the GPS precision when the SA is turned off :-).

Good point. But I think the wording "number of digipeaters in the unproto path" also covers this for the smart programmer.

Maybe we could insert "number of digipeaters or WIDEn-N hops"....

But it is only 60 feet square in the middle of the ocean. With selective  
availability, no station could maintain a 0000000000 posit for more than a  
few seconds anyway...

The null SPACES idea requires additional (exception) parsing, and is not  
worth that .0000000001 probability... in my opinion...:-) Bob

Yes, this is the same format.

> Something, please something, should be done to reduce these ambiguities!!!

I don't understand the ambiguity? A position report comment field can contain lots of stuff. This paragraph was an attempt to identify a number of those currently defined and in use.

Please note that the purpose of this specification is to document the way the system currently works.

I agree that this is a short coming of the system. However it should be a shortcoming that is addressed in APRS v2.0. If we wanted to open this

up to everything that could be better we would be here all day. I have things I think should happen.

Now as to bobs comment: Anything worth doing is worth doing right. If someone wants to lower a sea anchor and manually enter a position into there system of 0.0000000000N 0.000000000E then they should be allowed to and the system should work. What happens if there happens to be oil at that location? The rig could actually be there.

Also many standards state that there are things a compliant system should do versus things the system must do. Perhaps we should include this as a should do in 2.0.

Charles

Well, this has been a MAJOR point of contention between Bob and myself  
over the last year. I am completely unconvinced that there is a need for  
ambiguity in the first place. What we finally decided after an great deal  
of arguing is we would place it into the protocol, but it is up to the  
individual programmer on if, and how, to handle the ambiguity.

All my software treats 072\_\_.\_W as 72.00000, and will continue to. I do  
not find any display method yet proposed satisfactory for conveying  
ambiguity...I do not like stations simply disappearing as you zoom in on  
a map, and using circles or squares results in a clutter map and is  
difficult to associate a particular callsign with a zone of ambiguity.  
Finally, there is no way at all I could handle these on the map.aprs.net  
system.

This is not an option. It is impossible in the Mic-E algorithm to specify  
this position.

Yes, and SA has not been turned off since the Gulf war for an significant  
length of time. It is about 350 miles from the nearest land, too far for  
DGPS. So, in order for this to be a significant problem, you would need a  
marine mobile APRS station deliberately keeping station within the 20  
meter box at 0N 0W and SA being turned off. That's pretty close to my  
definition of highly unlikely...

Paul,

Yes, there are lots of possible ways to indicate a NULL position. But for the SPEC of what APRS is today, it is 0000/00000. Nothing will change that in APRS version 1.0. That's just the way it is in all current hardware and software....

Sorry...

Bob

----- Original Message -----

From: Steve Dimse <[k4hg@tapr.org](mailto:k4hg@tapr.org)>

> I guess I'm not clear on your planned usage of this. These codes are  
> reserved for specific software and hardware implementations of the  
> protocol.

My planned usage for this is to act as a general indicator of what protocol version is in use by a client. APV101 would indicate APRS protocol ver. 1.0.1 is being used. I still think assigning a specific code to each individual software/hardware implementation isn't as useful as tagging the protocol being used.

If I write a software implementation of APRS and I chose to support V.1.0.0

of the APRS protocol, I could use APV100 to identify my software implementation as being APRS V.1.0.0 compliant.

> While the APRSWG hasn't specifically addressed the mechanics of handing these out, ...

How can you open a protocol to public comment, and not have any plans in place to act on them?

> I suspect we will want to wait until someone has a  
> program or device ready for on-air testing, since we have a limited  
> number of available codes.

What if I start using APV at my site, lets say within the next 2 days?

73,  
Bill

The following related comments apply to Chapter 10, APRS Protocol Version 1.0. For these comments, LSB is numbered as zero.

1. Page 37. There appears to be inadequate definition in MIC-E Destination Address Field-

The fifth bit in each of the first 6 bytes of the destination field is not adequately defined. It is shown by the symbol "x" (the 9th bullet on page 37) which we are told is either a 0 or 1. However, there is no definition of where the 0 or 1 come from. We can handle the value of x as being part of the bit pattern for the corresponding letter and then follow the table. However, what is the purpose of the "x" parameter? The condition corresponding to 0 and the condition corresponding to 1 should be specified...unless it's a secret! Is it just a flag to indicate the shifted sequence? If so, why even bother since the P thru Z sequence could convey the same information.

2. page 38. The convention on latitude digit for letters A thru K is not clear-

The representation on page 37 indicates the latitude digits are the numerical value of the nibble made up of bits 1 thru 4 (shown as "dddd" in the 1st and 2nd bytes, "mmmm" in the 3rd and 4th bytes and "hhhh" in the 5th and 6th bytes). For the letter "A", the nibble is 0001. This is clearly the decimal value 1, not the decimal value 0 shown in the upper table on page 38. For "B", the corresponding nibble is 0010 which is the decimal value 2, not the decimal value 1 shown in the table, etc. for the remaining letters in the A to J sequence. They are all shifted by 1. Possibly the notation "(custom)" in the table indicates it is a look-up table (consisting of a offset-by-one pattern) for the A to J sequence rather than the numerical value of the nibble (which would make more sense!). If so, it should be stated- and one would wonder the reason (and value) for this difference in representation over the more straight-forward direct numerical value of the nibble.

I may have missed some reason for the above. Explanation or corrections of interpretation would be appreciated.

Thanks.  
Lief Hendrickson

At the DCC 1999, Keith Sproul mentioned that the Shelter data formats are defined, just not implemented. I have searched the spec, but did not see a reference to the message format. If it is not in a current program, I assume it does not go in the spec?

If there is a working format, it would be helpful for on-going development efforts rather than define a new one.

Thanks,

Tom NY4I

They were 'tentively' defined, and the definition was NOT good enough to satisfy even a small group of people, so instead of wasting our time on something that was only partially defined, we left that out for a future version, since the ONLY thing that accepted it was WinAPRS/MacAPRS, and even that was only done as a test and wasn't even close to finished.

There are some major definitions of what NEEDS to be in the data, but other than some examples that sort-of worked, not much else was completed..

I will be looking for people to help on this as time progresses..  
This will be done through the official WG, allowing many people to have input..

In article <LYR11659-55462-1999.12.16-13.23.28--ian#dowrmain.demon.co.uk@lists.tapr.org>, Bill Cleveland <billc@zebra.net> writes

>If I write a software implementation of APRS and I chose to support V.1.0.0  
>of the APRS protocol, I could use APV100 to identify my software  
>implementation as being APRS V.1.0.0 compliant.  
>

In principle, yes. If your software is really in \*full\* compliance with 1.0.0 then you could conceive of using something like APV100.

But in practice it is very \*unlikely\* that individual software or firmware

implementations will ever be in \*full\* compliance with the spec (hardware restrictions may even constrain the implementation to a subset of the spec). The current authors may prove me wrong, but I don't think any of their implementations \*fully\* comply today. In that case they could not use APV100, so what would they use in its place?

That is why the current scheme of software version number is more meaningful, and potentially helpful with debugging when things go wrong, especially when looking at rogue packets many thousands of miles away!

This conversation reminds me of high school chemistry class:

"But teacher, my gram scale{that I just dropped on the floor}  
does say 5.89746258304620398462gm so it still must be right  
to the 20th place"

Knowing the level of precision (or ambiguity) was a key part in  
getting a good grade in my chemistry class. In navigation it  
can be the difference between life and death.

EXACTLY. You have to represent the degree of precision that the sensor  
reports. And you MUST NOT increase its accuracy as clearly this leads  
to increasingly inaccurate results farther down the line

> Well, this has been a MAJOR point of contention between Bob and myself  
> over the last year. I am completely unconvinced that there is a need for  
> ambiguity in the first place.

Some navigation sensors are better then others, and give a more precise  
result. Such as GPS vs. DGPS vs. Loran vs. dead reckoning (and more). So  
quite clearly, as each of these has varying levels of "preciseness" there  
exists the need for a ambiguity reporting in any system that can use these.  
This is navigation 101 stuff people. Bob knows what he is talking about.

Also, getting into something a little bit more obscure (but equally important) KNOWING the level of ambiguity is a KEY factor in doing any kind of sensor fusion (such as Kamin filtering).

> What we finally decided after an great deal  
> of arguing is we would place it into the protocol, but it is up to the  
> individual programmer on if, and how, to handle the ambiguity.

At a end user display terminal, with ABSOLUTELY NO CHANCE of passing the munged data on, then this is fine. But if the station, or application can pass this data on, it must retain the level of precision (ambiguity) of the data. To actually change the data by removing the level of precision should be one of the "thou shall nots" of the APRS SPEC.

> All my software treats 072\_\_.\_W as 72.0000, and will continue to.

As long as your not passing this on to another station, then this is fine. I'd strongly suggest a visible warning in your program that indicates you are munging the data in such a manner. I'm not sure what you are developing, but if it is ever used for navigation, and a accident results from this (undisclosed) munging of the data, there could be ramifications.

But the APRS-WG must not allow certifications of programs that increase the level of precision and \*then\* pass the data on to another station at a reduced level of ambiguity (Such as passing on 072\_\_.\_W as 72.0000). This is completely unacceptable in any type of navigation or avl system.

-Jeff

P.S.

FYI (regarding coordinates 0.00, 0.00):

> Yes, and SA has not been turned off since the Gulf war for an significant  
> length of time. It is about 350 miles from the nearest land, too far for  
> DGPS.

There are more ways for DGPS then just the coast guard long wave stations. The OmniStar ASAT satellite does cover this area. See:

<http://www.omnistar.com/region.html>

This is not what the field is intended for. You have no idea how  
frustrating it is to have someone send you a message saying "the packet  
from WZ9ZZZ isn't decoded by your program", and then to go dig out a  
packet from that station, see it is incorrectly formed, and have no idea

which program sent it.

This is why the author/manufacturer field is there. It is very much appreciated by those of us that need to troubleshoot the system, and needs to remain in place.

And once again, Version 1.0 of the protocol documents what is in place today...

>> While the APRSWG hasn't specifically addressed the mechanics of handing  
>these out, ...

>

>How can you open a protocol to public comment, and not have any plans in  
>place to act on them?

>

This isn't a difficult question, we are handling much tougher ones first. My proposal is to have a new author submit a request, and unless it is in conflict changes. When any new version of the protocol doc is produced for another reason, the changes are included. In other words, no need to re-issue the protocol every time a new code is assigned. Just my opinion, what the group decides to do may differ...

>> I suspect we will want to wait until someone has a  
>> program or device ready for on-air testing, since we have a limited  
>> number of available codes.

>

>What if I start using APV at my site, lets say within the next 2 days?

>

If you have a piece of software read to go on the air in two days, let us know the name of the program and a little something about it. This would cause us to bump the issue up in priority and settle the assignment issue now. Otherwise, it will wait for tougher things to be settled first, or for someone else to need an ID in the short term.

Or perhaps the question referred to civil disobedience, so-to-speak, of not getting a code issued first? The APRS protocol is a voluntary document. All the members of the APRS WG are committed to working with new authors to make sure their software is compatible with what we have in use already. If you want to ignore the resources that are offered you, there are no repercussions contemplated, though it would be a shame...

Steve K4HG

Ian,

I mention this in one of my other posts. but it may have gotten lost.

It is possible to write the spec in such a way that many of the features can be unimplemented and a product could be compliant. For instance if a particular implementation of the standard only transmitted one type of packet then that type of packet must be one of the types listed in the document. However an implementation should support at minimum the direct message packets and a location type packet.

In trying to keep this away from a Dr. Spock type document, some of the technical administtrivia is failing to be addressed.

The standard should be written such that every represented APRS implementation is "APRS 1.0.0 Compliant".

Hello -

I have just noticed what appears to be an oversight concerning Third Party Digipeating packet reformulation and the operation of WIDEn-N digis.

On page 67, last paragraph, it is noted:

Any digipeaters following the callsign of the station from which the packet was heard are termed "unused". These unused digipeaters are stripped out when building a Third-Party Header.

When a packet is received direct from a WIDEn-N digi, there is no "\*" to signify from which digi it has been heard. The only rule I can think of is to assume the LAST digi in a WIDEn-N chain if there is no subsequent digi marked with an asterisk. In our area (Oregon south of Portland), we get lots of packets from British Columbia with no asterisk!

Am I wrong or is there a better way?

Thanks,

Jim Wagner

When APRS1.0 specification is not intended to be a RFC style document,  
some inexperienced programs might not think about the possibility of  
illegal values in some data fields, thus I think it would be a good  
thing to say in the document what to do in that situation e.g. crash  
the program (hopefully not) or handle it as a default null position

(whatever that is now or in the future).

>>What should the application do with 9999.99N ? IMHO, this is a much  
>>better null coordinate than 0000.00N/00000.00W, which would remove any  
>>ambiguity with a real position and a null position.  
>>  
>This is not an option. It is impossible in the Mic-E algorithm to specify  
>this position.

I must have missed something, since my interpretation is that the latitude is transmitted in the destination address as six BCD digits, thus, I do not see a problem of representing 9999.99N or 9959.99N. In fact in the third BCD digit (tens of minutes) the MSB is always 0, since that digit can only vary from 0 to 5, thus three bits would be sufficient :-).

It would have been a simple thing to encode the uncertainty in the less significant digits by using an invalid BCD digit e.g. the binary combination 1010 (ten) to indicate unavailable data, but unfortunately no-one seem to have thought about this when the Mic-E specification was initially designed.

>Yes, and SA has not been turned off since the Gulf war for an significant  
>length of time.

Is the US going to keep the SA on forever in the future ?

And besides there are other existing and planned satnav systems that are not using SA even if the US keeps it on the GPS system.

The default null position is of no consequence in Version 1.0.  
You will have to expand your algorithm a bit to note moving  
objects passing through the point. Otherwise mask the object.

In version 2.0 it can be done correctly, as I would hope it would  
be a binary protocol, rather than a character protocol.

There have been zero (null) Hams going to that point and operating  
Ham radio since APRS day 1, and none are projected. Why should  
we care now? Sure it could be designed better, and should, but not  
in this version: It's so small an issue that yawning is appropriate...

Good point Jim. You are correct since WIDEn-N propagates with the  
has-been-digipeated bit NOT set until it gets to 0. Hummh....

OK, but since the only call in that stream that will show a "\*" it the one  
prior to the WIDEn-N, then it will usually, if not always, be the  
originating digipeater. And that originating digipeater is probably the  
most useful piece of information available to identify where the packet  
came from. So far, no one has used any of this path information.

My first reaction is to leave it be. Or at least until we have an idea  
of what good it would do to work up a work-around..... But you have  
identified a small "quirk" that should not be overlooked in the future if  
we do use this path info...

Bob

That is EXACTLY what we did. The SPACE character... in conventional  
APRS formatted LAT/LONGS and a shifted ALPHABET in the Mic-E...

If you assume that WIDEm-n has been used if 'n' is less than 'm', the only situation in which you will be wrong is if someone originates a

frame with something like WIDE7-5.

This (no asterisk) should only occur when the originating station is within  
direct reach of a WIDEn-N digi, and so doesn't need a RELAY or other station  
before the WIDEn-N in the path, correct? Then the only time you'd see ANY

asterisk is when you get to the last digi.

If there's a RELAY or other digi call before the WIDEn-N, then the asterisk would appear by that station's callsign until you get to the last WIDEn-N digi, correct?

Just making sure I understand.

I dont think so. Some digi will always hear the RELAY first, so it will  
(and must) always be digipeated by that call first. Thus, it will always  
have the RELAY\*,WIDEN-N or callsing substituted DIGI\*,WIDEn-N....  
Unless you hear the originator direct. then you will see one packet with  
no stars....

Bob

Actually, this is not at all obscure, now that I think of it. One excellent use of APRS is for coordinated automated direction finding. That is, both mobiles and bases can DF a transmitter, and share their bearing, location and signal strength. Since this data is being shared, it is CRITICAL that each program not put there own spin on it.

A particular

yagi has a different degree of precision then a doppler. A base station has a different degree of precision then a mobile (maybe the base station used SA watch to survey there location?), or maybe the mobile doesn't even has a GPS, and is just entering street coordinates of there latest fix. And what about the bearing tools? Are they guessing it by eye or are they using a fluxgate compass with +- %5 accuracy?

Since all the data can be shared with other stations in coming up with a DF fix solution, it is important that the level of ambiguity be shared. For any certified APRS application, it is critical that the particular author does not have free rein to munge the data as they see fit.

It is claimed the WG agreed to allow the authors to munge  
position ambiguity any way they see fit. Since their public silence  
on this issue seems not impugn this, can we assume this is true?  
I cannot find any position ambiguity munging rules in the present  
APRS-SPEC document.

These munging rules need to be in the document if the statement  
below is true, and most certainly need to be part of the certification  
process.

Hello group

The description on pages 67, 68, and 69 do a good job of describing how a tunneled message is parsed at the gateways. But, it says nothing about how it should be parsed at the receiving station.

When I look at the rough draft, it does just the opposite, describing how it should be parsed at the receiving end but not at the gateway.

Shouldn't the standard have both?? Its not obvious to me that the gateway spec is a sufficient description to determine what to do at the receive point.

Thanks

Jim Wagner

On Dec 16, I posted a note about possible problems with Third Party  
Digipeating and WIDEn-N digipeaters.

Here are two use useful examples. The first is pretty normal and leaves  
little doubt in my mind what the "local" digi is. The second shows exactly  
what I was concerned about.

VE7DIE>APW240,N7IFJ-10\*,WIDE5:}VE6DJJ>APW228,TCPIP,VE7DIE\*:=5100.98N/11359.23W\_P  
HG3230/WinAPRS 2.2.8 -ABCANCALGARY -228-<530>

N7RIG-4>APRX44,WIDE5-2:}N7RIG-4>APRX44,WIDE5-4/V:}N7RIG-2>APRZIP,ZDIGI:>090209z  
Richard Seattle Wa. 72155.1222@compuserve.com

Can someone, anyone, tell me whether the second was heard direct or whether  
it was heard via WIDE5-2? If the packet was properly addressed (initially  
to WIDE5-5), then it was probably heard via WIDE5-2. But, I rather doubt it  
in this case because many, if not most, of the WIDEn-N digis between the  
originating area and the authors location can be heard directly at the  
author's QTH.

So, what is one to do????

Hello, group...

In the absence of a formal description for parsing received Third Party packets, I have been trying to follow the description in the rough draft of the APRS protocol spec. I've run into a problem with the following packet:

```
K7IP-2>APS199,KSEA*,WIDE3:}KH2Z>APS199,TCPIP,K7IP-2*::SECTIG :etxt  
kh2z@arrl.net KH2*{951
```

The rough draft says: "To show that it has been carried by another station, the call of that station is extracted from the as-received header and inserted as a pseudo digi in the digi path."

Lets see, when you do that with the previous packet (and trim the unused part of the local digi path), you get:

```
K7IP-2>APS199,KSEA*,WIDE3:}KH2Z>APS199,TCPIP,K7IP-2,K7IP-2,KSEA*::SECTIG  
:etxt kh2z@arrl.net KH2*{951
```

Clearly, there is an error. There are two successive instances of the same call. Any of the following might be true:

1. The packet was incorrectly parsed at the gateway
2. The rough draft algorithm is incorrect
3. Some other error

Can someone illuminate?

In the absence of a formal receive decoding algorithm description in the protocol, this kind of stuff is going to continue being a question.

Thanks,

Jim Wagner  
Oregon Research Electronics

- 1) you can not reconstruct the original packet path from 3rd party packets
- 2) the pseudo header in your example tells you that [1] KH2Z originated the message, [2] using APRS+SA, [3] heard via TCPIP, and [4] gated by K7IP-2.
- 3) The local header, K7IP-2>APS199,KSEA\*.WIDE3 only tells you the packet back to the IGate K7IP-2. Including this path with the header in the 3rd packet is wrong, and meaningless.
- 4) 3rd party format, as transmitted by an IGate, does not tell you how the original packet got into the Internet data stream, only that KH2Z was the originating station.
- 5) sending messages back is transparent. You only need to be assured that your signal gets back to your local IGate.

>VE7DIE>APW240,N7IFJ-10\*,WIDE5:{VE6DJJ>APW228,TCPIP,VE7DIE\*:=5100.98N/11359.23W\_  
>P  
>HG3230/WinAPRS 2.2.8 -ABCANALGARY -228-<530>

If that is off air, and the TNC you are using outputs decoded frame headers in "TNC2" format, i.e. the '\*' is put against the last digi with the 'H' bit set (equivalent to putting it against the digi you heard it from), then it must have originated as:-

VE7DIE>APW240,N7IFJ-10,WIDE5:

And the WIDE5 would appear to me to be redundant.

>N7RIG-4>APRX44,WIDE5-2:{N7RIG-4>APRX44,WIDE5-4/V:{N7RIG-2>APRZIP,ZDIGI:>090209z  
>Richard Seattle Wa. 72155.1222@compuserve.com

>Can someone, anyone, tell me whether the second was heard direct or whether  
>it was heard via WIDE5-2? If the packet was properly addressed (initially  
>to WIDE5-5), then it was probably heard via WIDE5-2.

If the packet was properly addressed (started off as WIDE5-5) then it was \*definitely\* heard from WIDE5-2.

> But, I rather doubt it  
>in this case because many, if not most, of the WIDEn-N digis between the  
>originating area and the authors location can be heard directly at the  
>author's QTH.  
>  
>So, what is one to do????

I would say:-

- (a) Educate the users in how WIDEn-n should be used.
- (b) Assume that it has been used if the second 'n' is less than the

first.

Possibly off topic, but just to throw in another slight complication, the spec describes only two different formats of decoded frame headers - TNC2 and PK-232 (which shows what a sheltered life you folks over there lead! ;-). There are others! If your first example had come from a system using BPQ host mode (very popular in the UK), then it would have to be interpreted as having been heard via a used up WIDE5-5, because the '\*' in BPQ decoded frame headers simply indicates that the address 'H' bit is set, so a frame header that has gone through three digis would be decoded as:-

G4IDE>APRS,DIGI1\*,DIGI2\*,DIGI3\*,DIGI4,etc...

Finally, a question - when WIDEn-n counts down to an SSID of '0', should the digi that outputs the frame with WIDE5(-0) set the 'H' bit? I think it should, but I also don't think that all implementations of WIDEn-n do. (Same applies to TRACEn-n.) So, should WIDE5, or WIDE5\*, or both, be regarded as a used up WIDE5-5?

Yep, thats why I included the Quality factor in the DF bearing info. A  
quality factor of 8 implies a very narrow accuracy, where as a quality  
factor of 4 might mean a 45 degree precision, and a quality of 1 might  
mean +/- 90 deg. Actually, the graphics in APRSdos did not make it easy  
for me to translate these into ambiguity sectors, but that was the  
intent... Hummh... Maybe for the future, we should equate these DF  
quality factors in to specific ambiguity wedges?

<snip>>  
> So, what is one to do????

Good question. Lets try this answer (discussion) and see what everyone thinks???

\* APRS doesnt care how a packet gets somewhere. It was designed to assume a flooding network where everyone involved in a NET, Emergency, EVENT or whatever, is responsible to choose an OUTGOING path to hit all other stations in that "NET, EVENT" Emergency".

\* This works, and will always work at the "scene" and in an "area" of interest.

\*\*\* Problem is, everyone coming on board now sees the state-wide, nation-wide, world-wide APRS network as a means of communicating anywhere and everywhere. Yes, it can be done. But it will get harder and harder.

\*\*\* Even as this "global" nature of APRS grows, we have always said that growth will be handled exactly like cellular, we make the cells smaller so that they can always accomidate a finite number of users within that cell.

\*\*\* This is why I keep saying that the only important PATH info is the "originating" digipeater. From that alone, we should always be able to figure out how to get back to that person.

\*\*\* WIDEn-n vastly improves network efficiency at the expense of lost path info. (at least n-N can tell you the number of hops)... But again, WIDEn-N is only a means of allowing geographically disperse users in a very large area to communicate in APRS where otherwise, there would not have been a critical mass of users to justify its use.... BUT THIS IS NOT what APRS was designed for...

So, simple answer (but controversial) to Jim's question might be "who cares"? Are we trying to build and maintain a 5 hop system, or are we going to remain focused on the one hop (maybe 2) real time "event" scenario?

k

When Kantronics was implementing it, that is what I told them to do... I  
don't know if they did it that way or not. Not enough WIDEn's in my area  
to test....

Don't know what you mean by munging...that generally implies changing  
something. This situation is simply ignoring the ambiguity, so I would  
not choose that term.

Position ambiguity is in the spec. All programs need to handle position  
reports containing this data format. The spec does not contain  
information about how this, or most other things, are to be displayed by  
individual programs. My opinion was that this document should contain no  
requirements on how things should be displayed by client programs. For  
example, the range omission Bob posted the other day...there may be a  
need for documentation of things like this, but my opinion is they belong  
in a separate document, just as the Internet info should be a separate  
document. However, some of them crept into the spec, I do not have the  
time or energy to fight all these battles.

However, ambiguity is one I feel very strongly about. I am completely  
unconvinced of the need for it, and even if I were, no one has  
demonstrated to me a method of adequately conveying it in any program,  
much less one that can be successfully implemented in all APRS displays.

IAN,

Here is another useful "Programmer aid" that might save programmers a lot of grief... in the area of GPSxyz decoding:

-----  
TIP: In the GPSxyz construct, there are 12 "x" table offset characters that designate the numeric offset to ADD to the "y" ascii value to get the final symbol. The "z" overlay character is one-for one. The following two lists of these "x" TABLE characters and their equivalent ASCII table offsets may be handy to the programmer:

"B-33,P00,M-24,H08,L32,J74" These will be "primary" symbols  
"O-33,A00,N-24,D08,S32,Q74" These will be "alternate" symbols

Bob

>to test....

A KPC3 with 8.2 firmware doesn't. (Easily tested by sending a frame via  
WIDE5-1, that way you don't need any other WIDEn's.)

So, to return to the original example -  
VE7DIE>APW240,N7IFJ-10\*,WIDE5:}etc...

It's probably a "used up" WIDE5-5 with the last digi having been a  
Kantronics TNC.

Hi Lief.

The key to all of this is the table at the top of page 38 of the APRS  
Protocol spec draft (Mic-E Destination Address Field Encoding). It shows  
all of the possible ASCII characters (that will be left-shifted by one bit  
on transmission, per the AX.25 spec) for the first six address bytes.

Example 1: From the table, if the first address byte contains the letter  
"S", it represents the latitude digit "3" and a \*standard\* message "1"  
bit. The corresponding transmitted bit pattern is 10100110 (i.e. the  
letter "S" shifted one bit left). In this case, the "x" bit (bit 5) is  
"1".

Example 2: From the table, if the first byte contains the letter "D", it  
again represents the latitude digit "3", but this time with the \*custom\*  
message bit set. The transmitted bit pattern is 10001000 (i.e. "D" left  
shifted). In this case, bit 5 is "0".

So this shows how bit 5 can be either a "1" or a "0".

NOTE: In example 1, the latitude value corresponds to bits 1-4 (0011), but  
in example 2, the latitude value is one less than the value of bits 1-4  
(as you correctly pointed out).

This means that there is actually an error in the documentation on page  
37. The first bullet (under the format diagram) should read:

~~~~~  
* Six encoded latitude 4-bit nibbles specifying degrees, minutes ... etc
~~~~~

That is, the word "encoded" replaces "binary-coded-decimal", since the nibble is not necessarily a BCD digit as originally stated.

Bottom line: the table at the top of page 38 is the fundamental definition of the address encoding. I will be changing much of the the text on page 37 to emphasize this. I will also be adding examples like the ones above.

Sorry for any confusion -- this thing had me confused for months before I finally cracked it!

Yes, you are changing something.

Steve Dimse wrote on 16 Dec 1999 in a message titled "Re: Default Null":

> All my software treats 072\_\_.\_W as 72.0000, and will continue to.

Now 72 degrees is not 72.0000 degrees. Depending on the rounding method, your reading of 72.0000 degrees could be off up to -0.9999 degrees. And for most flugate compasses, you can only indicate to the nearest 5 degrees, meaning your error would now be off up to -9.9999 degrees.

Now, \_\_\_pay attention\_\_\_ to this next paragraph. It is the key to the misunderstanding I think we have here.

This munging is fine as long as you understand this error and it is acceptable to you. The problem comes into being when (or if) a author decides to pass the munged (incorrect) data on without passing on the degree of precision (or ambiguity level) TO ANOTHER STATION.

> The spec does not contain  
> information about how this, or most other things, are to be displayed by  
> individual programs.

I have no concern at all about end user display applications. Re-read the message you are replying to.

> However, ambiguity is one I feel very strongly about. I am completely  
> unconvinced of the need for it, and even if I were, no one has

> demonstrated to me a method of adequately conveying it in any program,

Then the spec is incomplete. If the spec is going to include ambiguity, it also needs to include a way to convey ambiguity (which it appears to do). If you don't agree with the spec, then I think you should either remove it or document it better. I don't think the solution is to ignore the spec as you suggested in another message.

>However, ambiguity is one I feel very strongly about. I am completely  
>unconvinced of the need for it, and even if I were, no one has

As what we are discussing is basic high school chemistry stuff, there must be some sort of misunderstanding as I know you are a smart person.

So explain to me exactly why you are unconvinced of the need to convey ambiguity in APRS?? While you have stated this on at least two occasions, you yet to have actually told anyone here why you feel this way (other than in a end user display app, which is not the concern, as we both agree on).

>demonstrated to me a method of adequately conveying it in any program,

> much less one that can be successfully implemented in all APRS displays.

Again, re-read my message(s) on the topic. I said nothing about display applications. I said when the data is passed on to another party.

I've attached the specific parts I'd like addressed, including the quote from Paul Keinanen who first pointed out this error.

So either everyone follows the rules for ambiguity (and doesn't munge the data) or specific munging rules are added to the SPEC indicating in what cases (such as end user display apps) that munging will be allowed. You can't leave this out of the spec as it will make the whole section on position ambiguity pointless.

Or is this already in the SPEC and I am just missing it?

As it stands now, you are saying there is a undocumented rule that no-one need pay any attention to the ambiguity spec. This exception needs to be documented, and as it is not, my OMISSION comment seems valid

Thank you

-Jeff

-----

It is claimed the WG agreed to allow the authors to munge position ambiguity any way they see fit. Since their public silence on this issue seems not impugn this, can we assume this is true? I cannot find any position ambiguity munging rules in the present APRS-SPEC document.

These munging rules need to be in the document if the statement below is true, and most certainly need to be part of the certification process.

-Jeff

In a number of locations (page 28 is one example), the format description calls out time as optional for the !, =, /, @ formats.

>From what I can make of the format descriptions:

! and = specify location messages without timestamp, and  
/ and @ specify location messages with timestamp.

Clearly, timestamp is NOT OPTIONAL in any of these formats.

It is PROHIBITED in "!" and "="

It is REQUIRED in "/" and "@"

It is patently false to call it optional in any of these.

While I am impressed with the incredible work done to assemble this draft of the APRS protocol, to my mind, this is absolutely incorrect. And, it appears over and over throughout the spec.

This is not "just a matter of semantics". It has to do with truthfulness and accuracy for programmers yet to come onto the scene.

It's difficult to see why the Mic-E destination address is presented in  
its AX25 link-layer format.

In article <LYR11659-55918-1999.12.19-04.14.52--ian#dowrmain.demon.co.uk  
@lists.tapr.org>, Roger Barker <roger@peaksys.co.uk> writes

>  
>It's difficult to see why the Mic-E destination address is presented in  
>its AX25 link-layer format.  
>

Roger, if by that you mean "why is the format diagram on page 37 shown  
the way it is?", then I agree. I almost omitted that diagram when  
writing the spec -- I only left it in because other people had  
documented that way, and it was familiar to a large audience.

Having discovered the errors in it, I have now decided to redraw it,  
omitting any reference to individual bits within each byte (for the  
first 6 bytes). The lookup table on page 38 says it all.

Hi All- this is a repost of my comments from Dec. 5th . This is the last day of the comment period for the protocol, and there has been zero discussion of the hurricane protocol. I can assume that either my comments are taken in whole- or are being ignored. I am not very upset at all this due to my intention to propose a shorter and more descriptive wind field

protocol after that is acceptable.

The hurricane spec changes the order of the data in the pressure and wind field areas. This means to implement the draft a 100 % changeover in user software by the next hurricane season.

I have serious problems with what I consider "geocentric" definitions:

There are parts of the world that do not use "hurricane" for a severe tropical cyclone. They are called Typhoons, Tropical Cyclones, Severe Tropical Cyclones etc..

The winds are defined as MPH. This is a major problem due to the more universal standard being knots. Internally at the National Hurricane Center they use knots and only convert to MPH for "Public" statements designed for U.S. distribution. The vast majority of bulletins from Guam, Miami and Honolulu are in knots. If a user wants the winds to show in MPH, the display software should do the conversion.

Radius should be in Nautical Miles to be consistent with knots.

Drop the business about gusts being in the last 5 minutes- this is not real time data but estimates of winds possible (even in "present" positions)

Time should be the "Valid" time of the object- not the time received or transmitted

The names used in the example will not work- send two objects with the same name and only one will be kept, the first will be overwritten.

Hi Dale --

I just wanted to let you know that your comments are in the queue.

Although many of the comments posted to the list have resulted in lively discussion involving Ian and the various authors, that discussion is really outside the formal process, which calls for all comments to be considered by the WG after the comment period closes. Please don't take the lack of discussion on this list as a sign that the comment hasn't been noticed -- if the authors haven't been thinking about it already (and I don't know whether they have), they will see it again when I bundle up the set of comments and hand it to them in the next couple of days.

Yes, I appreciate that it already existed, and that a large number of people had already torn out some hair trying to understand it! ;-)

The point is, of course, that most APRS applications handling Mic-E data will be using the destination address in its ASCII, i.e. not AX25 shifted, format. Exactly as they will use every other AX25 destination address in its ASCII format. (Most applications wouldn't even be able to access it in AX25 format.)

As a general point - I don't think the spec should concern itself at all with link-layer implementation.

I agree. I always think in terms of its ASCII "displayed" value. I think  
talking about all the shifting just encumbers the details...

Bob

A quick line to thank everyone who's contributed to the discussion of the APRS Protocol specification draft. Your feedback has given me and the APRS Working Group a lot to think about over the holiday!

As Working Group Chairman John Ackermann said yesterday, please don't think we're ignoring your points if we didn't comment on them. There just wasn't time to address every one of them in this list before the deadline.

I now have a hardcopy of all the comments and will be going through them in detail with the Working Group. Once I have a better feel for how long this will take, John will make a public announcement saying when the Working Group will publish the final version of the spec.

Meantime, have a great Christmas and New Year's!

73

To: "APRS Spec Discussion List" <aprsspec@lists.tappr.org>

The section on MESSAGES and ACKS is ambiguous about what constitutes a valid "ACK". Some authors require the FROM-CALL of the ACKing station to MATCH while others only rely on the message number.

Where this problem is seen on the air is in the following example:

Station A sends an email message via the EMAIL engine. His outgoing message is addressed to the pseudocall of "EMAIL"  
The reply ACK comes back FROM the callsign of the engine's TNC, not the matching callsign "EMAIL".

#### SOLUTIONS:

- 1) Sprouls solved it by making an "exception" to the callsign "EMAIL"
- 2) Brent solved it by accepting any matching ACK number regardless of who sent it...
- 3) APRSdos wont accept the EMAIL ack, because it is not from the matching TOCALL.

None of these are good permanent solutions. I think the following:

- 4) The "right" and most general solution is for an EMAIL engine to use

KISS mode and to send back the ACK with the proper "EMAIL" from call.

I am not picking on "EMAIL" here. it is just one example. There are also ICQ and other pseudocall engines that will be used on APRS...

BOTTOM LINE. Does the SPEC need to solve this problem by making a stand on the requirement (or lack of requirement) for a CALLSIGN match for ACKS?

At this point in spec 1.0, maybe the politically correct position is to add a sentence at the top of page 58:

Whether or not the FROM-CALL of the ACK is required to come from the same callsign as the ADDRESSEE is implemented differently in different versions. This issue is currently unresolved...

Ian,

Thanks for your response. Good explanation about the fact that the latitude nibble is encoded rather than simply the numerical value of the nibble. The examples you gave were "S" and "D". The question still remains of why a transmitting station would use one set of letters over another (A thru K versus P thru Z). As you show, the "S" and "D" mean exactly the same. The only difference is whether bit 5 is "0" or "1". Well, the value of a bit being "0" or "1" conveys information. So bit 5 does convey information though no mention is made of what information is

conveyed (if any!) Why would make a system choose use of "S" over use of "D" (per example)? If no information is conveyed, it should be so stated, i.e. the fact that the value of bit 5 being "0" or "1" is not used for any purpose (for the time being!).

If A thru K is equivalent to P thru Z why not just get rid of A thru K and streamline the decoding.

Thanks.

-Lief

>streamline the decoding.

Lief, A-K is *\*not\** equivalent to P-Z.

The latitude values happen to be the same in both those ranges, but the message "1" bit has a different meaning. If the character is "D", the *\*custom\** message bit is set. If the character is "S", the *\*standard\** message bit is set.

Example 1: If the first 3 bytes of the address are "D4F", from the table on page 38 you'll see this means:

- a. the latitude digits are "345".
- b. the message is a *\*custom\** message, because the address contains letters in the range A-K. From the table, the message bits (bits A/B/C) are "101". From the table at the bottom of the page, this corresponds to "Custom-2" (which can have any prior agreed meaning).

Example 2: If the first 3 bytes of the address are "S4U":

- a. the latitude digit are again "345".
- b. the message this time is a *\*standard\** message, because the address contains letters in the range P-Z. From the table, the message bits are again "101", corresponding to standard message "In Service".

Finally, forget about the meaning of any individual *\*bit\** in the first 6 bytes of the address. Any particular bit may be a "1" or a "0" depending on the ASCII character left-shifted. So bit 5 doesn't have any particular meaning -- just think about encoded *\*bytes\**.

[If you decide to write code to handle this, you could write out the bit patterns corresponding to every ASCII character (left-shifted) in the table, and then possibly decide you \*can\* handle individual bits algorithmically. Or you could take the easy way out and simply use table lookup. The choice is yours -- that's an implementation issue, not a protocol issue].

One more addition which I think is VERY important to convey to authors.

Insert at the top of page 58 after the ACK table something to the effect of:

APRS uses an end-for-end ACKnowledgment system. The probability of receiving an ACK degrades very rapidly as the number of hops increases. To counter this, authors are encouraged to implement schemes to add redundancy to ACKS. Schemes currently in use:

- 1) ACK all dupes of incoming messages
- 2) Do not filter out ACK dupes at Igates and Nodes
- 3) Generate multiple ACKS if a message is received over a long path
- 4) Schedule a duplicate delayed ACK if a message has been received multiple times
- 5) Remember, that modern DIGIS and APRServe filters all dupes within 30 seconds, so duplicates must be separated by at least 30+ secs.

Bob

Ian,

Thanks for comments. The discussion about interpretation is good.

However, the confusion in reading the spec is still there. The way the spec is written on page 37 is confusing. The spec just says "x" is a "0" or "1". A reader naturally wonders O.K. why the significance of saying a bit is either a "0" or a "1" (it couldn't be anything else but a "0" or a "1"!).

>From what we've discussed, when the "x" bit is a "1", it means the message bit is a custom. As you've pointed out, this is because the character set corresponding to the "Custom" designation fall in the A thru K range- these all have that bit equal to "1". So, why not just say that in the spec. If anything is to be said about the "x" bit, it should be more than the obvious that it is a "0" or a "1"- which is true of any bit!

Maybe the spec could say something like  $x = 1$  corresponds to a custom message. I know this falls in place from being in the A thru K set. One can already figure that out from the table. This is just a suggestion of what could be said about "x" if the spec is to identify it as a parameter- which it currently does on page 37. It's not good to have dangling parameters. Of course, then we have the problem of what to say about  $x = 0$  since that could correspond to the character set 0 thru 9 or to the set P thru Z- of which only the latter corresponds to a standard message. Difficulty in explaining the situation should not be a reason for ignoring it. I suppose it could be said the "x" bit just falls in place depending on other circumstances. However, its meaning should be addressed somehow if it is shown with its own definition line.

What does use of the character set 0 thru 9 say about whether a message is standard or custom? And what happens if the "x" bits of the first three bytes are different. This is not clear relative to the bottom table on page 38. (Please see comment after your example 1 below)?

Why did you use "4" as the second byte? If this example was intended to  
specify a "custom" message, it seems "E" should be used instead of "4" as  
the second byte.

Suppose the first three bytes were "D4U". This would still be the same  
latitude, but the first byte is "Custom", the second is neither "Custom" or  
"Standard", and the third is "Standard". Where would this fall in the  
table at the bottom of page 38?

>

>

Again, the second byte is neither "Custom" or "Standard". It could have  
been "T" instead of "4". In that case, the "B" parameter would still be  
"1", but its byte would be within the "Standard" character set. ...or is  
there some requirement I am missing about the character set of the second  
byte.

The table at the bottom of page 38 has a column for "Standard" and a column  
for "Custom". Yet the three bytes (the parameters "A", "B", & "C") could  
potentially be different in specifying "Custom" or "Standard" leading to  
confusion.

Well, I agree it is the combination of bits that is important. Using the encoding of the table will work. However, there is still the confusion of how to interpret something if there is inconsistency in use of the three character sets (Standard, Custom, and neither). For example, "D4U" or "DEU". If mixing types is prohibited, it should be so stated. Or perhaps specify something like- use only the first byte to determine type ("Custom" or "Standard").

It is a protocol issue in that there is the possibility of mixing the character sets and it isn't clear which one would take precedence. If the meaning of bit "x" is not important for a protocol spec, perhaps some other representation would be better- rather than simply saying it is a "0" or a "1" as shown on page 37.

Thanks.  
Lief

Yes, I know it is confusing. A few days ago I said I was going to rewrite it. In the next release of the document it will look quite different.

I still don't believe this is a particularly strong argument.

A trivial alternative is to simply ask WZ9ZZZ what software he or she is running. Why, you could even try sending an APRS message to WZ9ZZZ...

I believe there are much better uses that could be made of the AX.25 destination address, (such as using it as a multicast address, but that is another proposal).

By the way, including the APRS protocol version number somewhere in each APRS packet (although not necessarily in the AX.25 destination address as was proposed) has the significant advantage that when new versions of APRS are defined the receiver can determine whether to parse the packet as an APRS 1 packet or an APRS 2 packet. (I suppose I should save this mail for all the e-mail I will see that says: "We can't do that in APRS 2.0 because the receiver might try to parse the packet as an ARPS 1.0 packet".)

[Insert long editorial here about why now is the time to think about how we will migrate to new versions of the APRS protocol...]

Hello Group -

On page 30, under "advantages" (9th bullet), it says:

"Potential 400% reduction of raw GPS NMEA data length"

I hope that is a typo, or someone is a miracle worker. A 100% reduction  
would make it 0 length. How long would a message be when reduced by 400%?

I can see 40%.

Best wishes -

Jim Wagner

Hello All -

How does one distinguish a Mic-E destination address from one of the usual APRS net names?

Example: APW522 has a legit Mic-E translation, as far as I can see.

Please don't tell me that the parser has to wait until discovering the message type later in the packet!!!

Also, is it correct, as it appears, that if one has any net name filtering on, that most Mic-E packets will be lost?

Thanks....

Hello -

Is it required that all one bits in the ABC set be from the same Custom or Standard group?

For example, suppose that "E" were used to indicate Custom and 40 degrees. Would the character for 5 degrees have to be "F" or could it be "U"?

Should a Mic-E packet that mixes custom and standard group characters be rejected as invalid?

Thanks again -

Jim Wagner

Greetings -

In the expressions at the end of page 39, it says:

d+28: Binary degrees of longitude. To decode:

1. subtract 28
2. if the L bit is set, add 100 to get the final value of longitude
3. subtract 80 if 180<=D<=189

"D" is not defined anywhere!

This same construction is also used several times on page 40.

Please be more explicit!

Thank you,

Jim Wagner

Hi Group -

Here are some questions about Telemetry format

Question 1 -----

On page 54, is the Telemetry Sequence Number constrained to numeric characters?

Question 2 -----

What does one do with fewer than 6 quantities? Is it just terminated at the end of the last quantity used, or must the comma-delimited format be filled out. In other words, is

T#005,199

valid?

Or, is it required

T#005,199,,,,,

Or, is it required

T#005,199,0,0,0,0,0

Question 3 -----

Why are the "analog" values constrained to the range 0-255? Why not 0-511 or 0-999? I can think of a number of situations where higher resolution is appropriate.

Question 4 -----

Why is the last field called "Digital"? These are all digital in that they are discrete integers. The last field would be better called "binary" because it is a set of digits representing 8 binary values. I believe that this would provide better understanding of the function of the field.

Question 5 -----

Is there an error in the polynomial expansion example? For coefficients 0,5.2,0 and value 199, it shows an expansion of  $0 \times 128^2 + 5.2 \times 199 + 0$ . I believe that the first term should be  $0 \times 199^2$ . While it does not change the outcome (because the coefficient is 0), it makes it very confusing for someone to understand how to do the expansion.

Thanks

Hello, Everyone -

In the description of Messsage Acks on page 58, it says nothing about ack timing. Is ACK sent once for each message received or are multiple ACKs sent?

And, in the description of "message groups", it says "An APRS station can specify special Message Groups, containing lists of callsigns that the stations will read messages from (in addition to messages addressed to itself). Such lists are defined internally by the user at the receiving station, and are used to filter received message traffic."

Then, a paragraph later, it says:

"The receiving station will only acknowledge messages addressed to itself, and not any messages which were addressed to any group callsign."

Does this mean that some arbitrary "callsign" is chosen as a "group callsign" and members of the group assign themselves to respond to said callsign? Or, does it mean that a filter list is established and that a message addressed to anyone on the list is read as a message?

Many thanks -

Jim Wagner

Hello again, everyone .....

Here are a bunch of questions about queries:

(1) In the former protocol description, it was mentioned that stations responding to a general query respond at "random" times over a 2 minute interval, I believe. This seems to be absent from the new spec. Has it been forgotten, or is it no longer considered important?

(2) Case of query commands is never discussed. Are they always upper case?

(3) In the very first paragraph of the Query chapter on page 61, it says:

"A station may set up a file containing a list of one or more Station Capabilities. These define attributes for the station. When queried for its capabilities, the station responds by transmitting the contents of the file, preceded by the < Data Type Identifier."

Why is it necessary to include implementation-specific language? No file is required. Software could easily be written so that the operator checks boxes in a dialog and responds with a capabilities message derived from the dialog (without a "file" ever being created). I don't feel that this language is appropriate for the specification.

(4) I would like to see directed IGATE and WX queries. To me, they make a lot of sense. For example when I really just want the wx report from a specific Eastern Washington station, why should the network be flooded with a dozen or more useless weather reports? APRSW and APRSI would be ideal.

(5) How is a station to respond to a directed query for which it has no information. For example, suppose that a station is queried for its status, and no status message has been entered? Likewise objects and position.

(6) I would like to see a statement that a station should accept, without crashing, unrecognized query types. This would facilitate expansion of the query list while insuring that existing software does not balk at the new types.

(7) The format does not indicate HOW a station is to respond if it has not heard a the station specified in an APRSH query.

(8) The format does not indicate HOW a station is to repsond to an APRSD query if it has heard NO direct stations.

(9) The format does not indicate HOW a station is to repsond to an APRSM query if it has no unacknowledged or undelivered messages for the querying

station.

(10) How is an APRST query to be answered in the light of WIDEn-N digis? This is especially significant where the originating station might have used WIDE5-3 in its unproto digi list.

Thanks for considering these items....

Greetings again...

Sorry for this flood of questions. I've been on a trip and spent a lot of time spec reading!

Suppose that one wants to make a manual weather report, say hourly rain during a bad storm. What is used for the software type and equipment type? Its not RSW, its not any of those fancy things. Its a plain old rain gauge. I can visualize a number of other params also.

And, not only is there no "software type" or equipment unit specifier, there is no wind direction or speed or any of those other things.

How should this kind of thing be handled???

Again, thanks.

Hello again,

On page 16, the ICQ messaging is given the netname APICxx. Yet, nowhere is ICQ discussed.

Should this be given a "future" designation?

Thanks.

I finally completed my first pass through the latest draft of the APRS Protocol Reference document.

My primary observation is that Ian had done a tremendous job in compiling and editing the information about the APRS protocol contained in this document. We all owe Ian our gratitude for taking on this task.

My secondary observation is that I am not confident that the information is precise enough to enable me to unambiguously determine whether a specific implementation conforms to the APRS protocol specification. The following thoughts might be useful.

- o I suggest that language be added similar to: "The primary objective of this document is to foster the development of interoperable implementations of the APRS protocol." This notion will help us judge whether the document is complete, both now as we review the document and in the future as implementations and test suites are developed against the document.
- o I suggest that language be added to define a "conformant" APRS implementation. Perhaps, "An APRS implementation is said to 'conform' to this protocol reference if it exhibits all of the behaviors that are labeled as "must" and exhibits none of the behaviors labeled as "must not". This statement implies that the terms "must" and "must not" need to be used carefully, but I suppose that is what is necessary to achieve the interoperability objective.
- o Stated in the converse, I assume that if I create an APRS message that conforms to the protocol reference, and if an APRS implementation fails to properly receive that message, then this APRS implementation does not conform to the specification. (See, for example, RFC 1025, "TCP and IP bakeoff".)
- o I suggest that language be added that says that this document is the ultimate specification of the APRS protocol. In particular, any differences between this document and existing implementation or APRS certification test suites must be resolved in favor of the (possible amended) APRS protocol reference.
- o It may be helpful to specify the minimum behavior that an APRS implementation must exhibit to be considered a conformant implementation. For example, must a conforming APRS implementation be able to send all of the specified message types? Only some? Which ones? Receive all of the message types? Receive any of the message

types, (e.g., a tracker)? What does it mean to "receive" a message, (simply not blow up)?

- o I would consider replacing all unqualified uses of the term "APRS" terms such as "APRS system", "APRS station", "APRS network" or "APRS protocol". More precise use of these terms may help clarify which components are responsible for specific behaviors.

Anybody know how temperatures are sent using native APRS format?  
I assume it is t-01 though t-99, but I like to check first.

All values may have "null" values. Just enter SPACES, or DOTS...  
I prefer dots as in T...R...P... etc....

Since the original "complete" WX report is just part of the stations POSIT, the Query POSIT will always get you a complete WX report from any APRSdos or other software reporting in the "complete" format. Software that uses the "positionless" WX format should respond to the POSIT query with both a POSIT and a "positionless" WX packet.

> (10) How is an APRST query to be answered in the light of WIDEn-N digis?  
> This is especially significant where the originating station might have  
> used WIDE5-3 in its unproto digi list.

Same as any other. It just sends back a copy of the packet header "as received".

On the APRSSPEC list, I posted a suggested additional paragraph describing  
all the various ACK techniques currently in use to improve ACK  
reliability.

> [Concerning MESSAGE GROUPS]

> Does this mean that some arbitrary "callsign" is chosen as a "group

They dont "respond" other than capturing that message as if it were to  
them. (with no ACK)

> Or, does it mean that a filter list is established and that a  
> message addressed to anyone on the list is read as a message?

No. The former...

It might be neither. This is why all it takes is ONE byte to have a  
custom bit set to turn it in to a CUSTOM message...

Yep, you parse the TYPE first. Then you decide whether you need to keep the TOCALL data...

> Also, is it correct, as it appears, that if one has any net name filtering  
> on, that most Mic-E packets will be lost?

No, all Mic-E packets are passed through....  
Notice that on the Kenwood radios that MESSAGES, however, will use the appropriate ALT-NET call and so will be subject to filtering...

Greetings -

In my copy of APRS101g.pdf, at the bottom of page 39 concerning Mic-E  
encoding/decoding, the very last line reads:

3. subtract 80 if 180 B D D 189.

This is displayed on a Mac. I suspect that font-substitution has messed it  
up. Is it supposed to read

3. subtract 80 if 180 <= D <= 189 ?

If so, I would suggest the use of either (a) more universal font or (b) the  
avoidance of non-ASCII characters.

There are similar problems throughout the top half of the next page, page 40.

And, we also have the problem previously reported: The character used to signify "Current GPS Data" at the bottom of page 39 (and a few other pages) does not correspond to any character in the ASCII table, appendix 3. That is, if you copy that character into the Acrobat Find dialog, then search for other instances of that character, there is no instance of that character in Appendix 3! Yes, someone told me what that character is, but the Appendix 3 does need correction.

Which brings up a final question:

Just what is meant by "Old GPS data" and "Current GPS data"? Does "old" refer to data which is more than some specific age? If so, what age? Please clarify in the text. What is the expected software behavior with "Old GPS Data". It can certainly be valid if its in a vehicle that has not moved since it was Current GPS data, if that, in fact, is what it is supposed to represent.

Many thanks....

Jim Wagner

Has anyone else experienced this (with a Mac or otherwise)? I was particularly careful to include ALL the document's fonts in the PDF file, to ensure complete independence from the PDF reader.

Group -

My "complaint" about text originated from Acrobat 3.0. I've never seen any reason to "upgrade" until now. However, that does not invalidate my complaint.

Precedence: bulk

The APRS standard is a good one. However, there are some areas where the author has some strong differences of opinion. These areas do not involve the protocol, as such. Instead, they involve issues of author and user freedom. These points that I mention may seem nit-picky, or overly confrontative. I intend them as neither. It is simply that when a "you must..." is written into a standard, it becomes just that, compulsory. Where the over-the air protocol is concerned, that is very important. When it has to do with operator choice or author's choice of features, then it should never be in the specs. Yes, to "it is recommended..." or "it is desirable....", but not "you must...". Here are my issues:

=====

On page 9, under the topic of "Net Cycle Time", the standard says: "3. All stations, even fixed stations, should beacon their position at the net cycle time rate. In a stress situation, stations are coming and going all the time. The position reports show not only where stations are without asking, but also that they are still active."

It is the author's opinion that users should be able to control their beacon interval. Software I am writing offers a beacon interval named "Net Cycle" (and thats the default setting). But, it also offers other fixed intervals up to 60 minutes.

=====

On page 58, under the topic of messages, the standard says: "An APRS receiving station can specify special Message Groups, containing lists of callsigns that the station will read messages from (in addition to messages addressed to itself). Such Message Groups are defined internally by the user at the receiving station, and are used to filter received message traffic.

The receiving station will read all messages addressed to ALL, QST or CQ."

That last line does not say "should" or "can"; it says "WILL". The author believes that users have the right to determine which messages they read. Software I am writing accepts all messages, no matter who the addressee is. All messages appear in a "Message Window", if its open. And, if one opens a Message Window later, all messages within the last 24 hours of operation are shown. It is also possible for the operator to request an alert for messages addressed to ALL, QST, and CQ. But, it is the operator's choice whether or not to do this. I defend the operator's right to make this choice.

=====

On page 59, under the topic of bulletins, the standard says: "Users must be alerted on arrival of a new bulletin or announcement."

Again, it is the author's belief that the user should have control over what is seen and what is not. To that end, my program allows the user to choose whether or not to be alerted for either bulletins or announcements. That decision should be up to the user.

=====

Also, on page 59, under the topic of bulletins, the standard says: "A receiving station can specify a list of bulletin groups of interest. The list is defined internally by the user at the receiving station. If a group is selected from the list, the station will only copy bulletins for that group, plus any general bulletins. If the list is empty, all bulletins are received and generate alerts."

Again, I believe that it should be the user's choice to choose whether or not general bulletins will be seen when operating under a group bulletin filter. And, it should be the operator's choice whether or not to be presented with any alert for any conditions. Furthermore, this section describes HOW a bulletin filter list should work, while the author reserves the right to do the filter list as he sees fit.

=====

On page 60, under the topic of National Weather Service Bulletins, the standard says: "APRS recognizes special National Weather Service bulletins with addresses of the form NWS-xxxxx."

I believe that it is up to the software writer to determine whether or not NWS bulletins are recognized. In countries other than the United States, NWS bulletins do not, after all, even exist! I believe that it is my right to include, or not include NWS bulletin recognition; let the user decide in the "marketplace" whether or not this is appropriate!

=====

On page 61, under the topic of Station Capabilities, the standard says: "A station may set up a file containing a list of one or more Station Capabilities. These define attributes for the station. When queried for its capabilities, the station responds by transmitting the contents of the file, preceded by the < Data Type Identifier."

As discussed by this writer previously in the list, the author believes that it is up to the software writer to determine HOW Station Capabilities are

managed; it need not be done using  
an external file.

=====

On page 62, under the topic of Queries, the standard says: "All stations inside the specified coverage circle should respond with a Position Report and a Status Report."

It is the author's belief that station operators should have control over whether or not to respond to queries. To that end, my software allows operators to select a variety of conditions specifying which queries, if any, to respond to.

=====

On page 72, under the topic of Other Packets, the standard says: "Any packet that does not meet any of the formats in this document are assumed to be a status beacon and will show up as status as long as no other properly formatted status has been received. This allows APRS to accept any UI packet addressed to the typical beacon address to be captured as a status message. Typical TNC ID packets fall into this category."

This statement is immediately contradicted by a later paragraph: "Programs can decide to handle these, or ignore them, but they must be able to process them without ill effects."

Again, consistent with the author's position on earlier points, this matter should be up to the author and the user. My software DOES NOT display ID packets as "status" messages. They are shown in a Log Window, but do not appear in the Status Window. Again, this is a "marketplace" issue.

The APRS WG will address Jim's concerns, but since Jim has stated that he is producing code that will not abide by the paragraphs he noted in the standard, I think it useful to maybe reply to his comments briefly.

Jim raises some of the usual concerns for author freedom we hear from new authors and it points out how easy it is to look at APRS as a simple list of formats instead of a "communications system". APRS is for tactical real-time communications at special events, or emergencies, or "situations". Users, including late arrivals and newbies to the NET in progress must have a common set of minimum expectations.

I agree, that Jim has found some that may need better wording, but three of them I feel uneasy about:

Imagine how useful Software X stations will be at your scene in your net:

- 1) You cannot send an urgent message to ALL or QST and expect any of Software X users to see it. You cannot ask for radio silence, a quick QSY, or an urent call to everyone in the net. SoftwareX's users may or may not see the message.

2) At an event, or situation, you can make certain assumptions about the "presence" of stations based on their frequent situation reporting (their Posit and STATUS at the minimum net-cycle time. However, Software X stations have decided they will only beacon at a 60 minute or 2 hour or once every 4 hour rate. (Some people even have said once a day is OK!) Thus, they are invisible to the net... possibly until after the crisis is over...

3) Net control communicates to most users on the net via general Bulletins. OOPS, except for software X stations who have disabled general bulletins and so are unaware of these urgent announcements to the everyone on frequency.

These would concern me greatly if I were trying to use APRS at a situation...

Bob makes a good point. If one plans on associating a future product with the label of "APRS" they must include certain core functionality.

This appears to be outlined in the "Charter of the Working Group":

"APRS, developed by Bob Bruninga, WB4APR, is an Amateur Radio digital infrastructure for realtime and tactical digital communications. It is designed to provide communications during emergencies, but it is recognized to support routine round-the-clock global communications as well. Its applications include mapping, messaging, telemetry, and tracking. It uses a standard protocol over RF links, supplemented by alternate communication methodologies."

If I understand this correctly, this means that one *must* include a full compliment of code to support:

1. communications during emergencies
2. routine global communications
3. mapping
4. messaging
5. telemetry
6. tracking

Programs that exhibit a personality that is in conflict with the above stated purpose of APRS would place themselves in violation of the APRSpec and should not be certified (meaning, I assume, that the term "APRS" could not be referenced anywhere in the discussion or advertisement of the product).

As such, these developers would severely restrict the audience for their product, but - more importantly - failure to build-in this support could, potentially, place human life at risk.

On the other hand...there is no reason to restrict development to the above. There are plenty of folks who want to experiment with digital communications in non-traditional ways (<http://go.to/propnet>). For them, disaster communications is *not* the purpose. They are simply experimenters. *If* one wants to fly the "APRS Banner" in conjunction with software they are developing, they must include core functions. Anything in *addition* to this is "cream".

Of course, this is simply my take on the thread; put this together with \$0.99 and you get a Big Gulp at your corner MiniMarket. :o)

I have a couple of things to say.

Mapping is not an action of the protocol. Only something which can be done with the data acquired from communicating with this protocol. Now one might want to specify a datum to use to allow meaningful maps but otherwise mapping is not part of the communication chain. For instance the D7 does not map stations.

As for the certification of a product as APRS, if we are going to look into this, then the standard is going to need to be clearer about what is required and what is optional. Is a piece of software that emulates a Mic-E Not going to be an approved version? Or will it be disqualified

because it cannot receive messages and as such cannot notify the user?  
Is there going to be a special category for the Mic-E? If so is this  
the right way to write a standard?

Jim has the presented two items in his post. The first is that he  
disagrees with some of the will and must statements and prefers not to  
implement them. The second is that he disagrees with some of the should  
and can statements and therefore will not implement them. The first is  
an issue with the standard. This is something he needs to work out  
through the standard body. The second is perfectly allowable under the  
standard. If the standard body does not like this then the standard  
should be changed.

Just my 2 pennies.

Charles Suprin

Should the APRSpec include a "Flag Field" that identifies what "OSI Layer" that a particular protocol belongs to?

For instance...

...Identifying the packet-structure that a WX-Warning takes is a different level than what action a program is expected to take when it encounters same. Even then, does the program simply "send an alarm" (leaving the type of alarm up to the programmer?) or is the type of alarm defined as part of the application-level protocol?

Maybe a further definition of the APRSpec's charge is in order? If it is to deal simply with the structure of APRS packets, it seems that the base spec could be significantly simplified.

Let's also not forget that this discussion is v-e-r-y APRS(tm) specific. No other application of UI-Packets seems to be part of the charge of this working group. As such...in many ways, the application is driving the protocol, as opposed to defining an extremely open protocol that opens up UI-Packet application development.

This is not a criticism, simply an observation. and a point for consideration.

I have not been following the spec discussion in great detail, but would like to second that there is market for using UI-packets without APRS. There are a couple packages used by ARES/RACES in VA called ARESPACK and ARESDATA which are primarily for messaging and db query. I would be hoping to see these packages rewritten to use UI-packets only in place of current connect-type communication. That would potentially make way for replacing the MD EOC-to-EOC tcp/ip network with a UI network, and would also allow for specific APRS traffic to be gated from 144.390 onto the MD EOC packet freq. Then can network PCs in EOCs to run APRS or ARESPACK or ARESDATA or ..., utilizing a single tnc/radio/freq.

Bob -

Your concerns are well noted. However, I hasten to point out, many folks leave their APRS computers on 24 hours per day, whether they are there or not. Hence, none of these folks are able to respond, personally, in the timely manner you suggest that a "situation" requires. So, what's the difference?? They cannot exercise "net silence".

There are no requirements in the protocol that certain behavior be exercised in certain situations. How can you imply such behavior without explicitly stating it in the protol. Lacking such a protocol statement of behavior, you cannot expect the action you seem to expect (but which I do not).

Would it not be best to have stations that respond automatically, perhaps as a result of certain query requests, rather than expecting undefined personal action by undefinded persons who may not be at a keyboard to take the undefinded action??

Greetings everyone,

On page 16, in the "APRS Data Type Identifiers", there is reference to the APRS data type "." for "Space Weather". Like the reference in the same table to "Shelter Data" ("+"), there is no further discussion of this data type.

Since this document is supposed to represent current practice, should not BOTH "Space Weather" and "Shelter Data" be removed from the table? If folks want these symbols reserved for specific future use, then perhaps the table entries should be "reserved for Space Weather" and "reserved for Shelter Data"?

Many thanks and keep up the great work.

Greetings everyone...

I hope that I have not stirred things up too much. That was not my intention.

My intention was, and is this: If certian operational features are going to be required for stations (not software, but stations) in an APRS environment, then it MUST be spelled out in the standard. The following statment from the charter of the working group has been quoted:

"APRS, developed by Bob Bruninga, WB4APR, is an Amateur Radio digital infrastructure for realtime and tactical digital communications. It is designed to provide communications during emergencies, but it is recognized to support routine round-the-clock global communications as well. Its applications include mapping, messaging, telemetry, and tracking. It uses a standard protocol over RF links, supplemented by alternate communication methodologies."

Unfortunately:

(1) This is not part of the standard, and its the standard that counts, not the charter.

(2) Nothing I have seen guarantees STATION performance, even with software written by Mr. Bruninga. It depends on action by the station opertor, and if there is no operator present, then performance will fail.

If specific station behavior is to be required in order to operate under the banner of "APRS", then that behavior MUST be spelled out in the standard. Otherwise, it becomes a personality game - who's software gets the stamp of

approval and who misses? You MUST NOT stop at mere software performance; you MUST spell out what has to be done by all operating stations.

Very sincerely, I do not believe that the performance described by Mr. Bruninga is achievable with software written by anyone at the present time. It depends on operators. If emergency communication is the penultimate goal, as Mr. Bruninga seems to suggest, then it seems appropriate to me that this draft should be shelved, immediately, and the group should proceed with all due haste to design the protocol enhancements required to achieve this.

Here is an example of something that might achieve this: A query or other message requiring all APRS stations to change, automatically, to "disaster mode" (with a well-stated set of operating requirements). Perhaps there could be several "event levels" ranging from "disaster" (with one set of requirements) to "warning" to "event" to "normal". I would be more than happy to build this, or anything else which would guarantee STATION performance, into software I am writing, so long as it is spelled out in the standard.

Lacking a clear direction to achieve the goal stated in the charter, then the standard should be made more permissive in all matters other than message format.

Sincerely,

Jim Wagner  
Oregon Research Electronics

Jim,

Your last post hit the nail on the head. I have used the softer term "Common user expectations" in place of your "guaranteed performance", but I think we mean and feel the same objective.

As we evolved from a world of homogeneous APRSdos to an arena with more software writers it became harder and harder to meet the above objective. Thus as we wrote the SPEC, many of my original "it must" and "it should's" were forced out of the final wording in a spirit of compromise to just "get it out the door".

But your good questions have pointed out the problems that this kind of compromised wording will entail forever in the future... But maybe it might also lead us to a solution....

By now you have seen my suggestion for an APRS\*NET button and I think you independently suggested a similar "disaster mode" which might be the way to help us meet the above objective while also allowing for the more global 99% of the time use of APRS as a general comm tool...

As long as the APRS\*NET BUTTON is "obvious", is the start-up default, and can be easily found by a new user, then I think I am open to ideas on this kind of dual mode of operation...

de WB4APR, Bob

Actually, we dont need to change the 1.0 spec, since it is our atttempt to

codify exactly this fundamental level of common expectations.. But your suggestions to clean up the language to this intent are good ideas...

Greetings everyone....

What is the expected behavior of an object or item when the transmitting station just stops sending that information without "killing" it? For example, suppose that the station is reporting a thunderstorm location, and loses transmit capability as a result of the storm.

Should the map display fade out over a period of time? Or, should it just go away from the display after some time? If so, what time is reasonable before the fade begins or it disappears? If removal is not automatic, should the operator be able to remove a "stale" object? How would a user be able to know the age (since last transmission) of an object? How is it handled in other programs????

Many thanks to all of you,

Jim Wagner

Hello .....

Page 58 includes the following statement.....

=====

Message Groups

An APRS receiving station can specify special Message Groups, containing lists of callsigns that the station will read messages from (in addition to messages addressed to itself). Such Message Groups are defined internally by the user at the receiving station, and are used to filter received message traffic.

The receiving station will read all messages addressed to ALL, QST or CQ.

The receiving station will only acknowledge messages addressed to itself, and not any messages received which were addressed to any group callsign.

=====

I would like clarification to make sure what is being talked about with respect to "messages addressed to ALL, QST or CQ."

On the surface, it would appear from the location of this paragraph within the document that it concerns a packet of the type:

:ALL :This is an urgent notice to all APRS users in S. Florida

However, we ALSO have "destination callsigns" (page 13) of ALL, QST and CQ. Which are we talking about?

Further, it would seem that there is no functional difference between a bulletin and a "message to ALL". Since (page 59) "Users must be alerted on arrival of a new bulletin or announcement", does not a bulletin have the required effect, making the "ALL-message" superfluous?

Many thanks,

Jim Wagner

Hello, everyone -

My points concerning permission vs requirement of certain APRS operating conditions seems to have stirred a bit of a hornet's nest. Mr. Bruninga alludes to the possibility of not "approving" my software if it does not satisfy the conditions he deems necessary for emergency operation (thus, disallowing use of the trademark "APRS").

However, the genie already seems to be out of the bottle.

For example, the draft standard (page 59) requires: "Users must be alerted on arrival of a new bulletin or announcement".

How can this happen with a unit such as a transmit-only GPS position sender such as a "tracker"? There is no way that the user of such a device can be notified of anything, let alone an APRS bulletin or announcement. How can tracker software use the trademark name "APRS" and be so non-compliant?

More importantly, just what are the standards for approval for use of the trademark "APRS" and who sets those standards? Is it the (soon-to-be published) APRS standard? Or, is there another, never to be published, "standard" in addition to the published one, and existing only in Mr. Bruninga's head? If there is, will that standard be consistent, or will it change according to whether Bob Bruninga happens to "like" the applicant?

This is NOT to put Bob down. His contributions to APRS have been, and

continue to be, immense. But, this IS a very important question, not only for me, but for other developers coming along, unless, of course, the intention is to prevent new software from ever being written. I would hope that this is ludicrous, but recent commentary leads me to doubt that it is so.

Here is another, very closely related issue. Suppose that I go ahead with my software as it is presently written. Suppose, just for the sake of discussion, that I call it EPRS (Easy Position Reporting System) instead of the hoped-for easyAPRS. Suppose that I delete all documentation and software references to "APRS" and, instead, simply refer to "the protocol designed by WB4APR". Who is going to keep the two from being used in the same network? Is there an APRS-police which is going to say "this is our private network" and brand-X software is not allowed? Who, or what, is going to know? Who, or what, is going to enforce it?

Isn't it better to welcome the effort, and attempt, through persuasion and reason, to achieve the highest level of compatibility possible? Then, so long as the over-the-air STATION operation does not conflict catastrophically with other stations, label it "APRS-compatible" and call it good? And, again, who has the final say over whether or not it is "compatible"? And what criteria are to be used to determine this?

These are clearly difficult questions. But, they have to be addressed, because the content of the standards document is going to have a very large effect on the answers to the questions. And, the document contents will have a very big effect on what kind of compatibility there is. As I hope I have pointed out, its not THAT hard to create something that appears fairly compatible, and do it in such a way that it is attractive to users but not call itself exactly "APRS".

Hi Jim,

To be fair, unless you received personal communication from Bob, it was  
me that suggested that certain functions be present in developed  
software, lest denial of the APRS trademark.

That was pure conjecture on my part. The APRS Working Group is still  
hot-and-heavy doing what they are doing. A future phase is the  
establishment of a "Certification Process". That hasn't been done yet,  
and doubt the details of your eMail have even been considered. (again,  
conjecture on my part)

Don't underestimate brand-name recognition in your quest to develop  
software. APRS is well known (and more so every day) in the US. If you  
are looking to market a successful product, I'm sure you've considered

the need to be directly associated with such a well known application. By the same token, because APRS is so well known, it becomes important to document its' definition (the work of the APRSwg) so as to assure the highest quality of its implementation.

Keep thinking outside of the box. It sounds like you've got some ideas that may really take off once the APRSpec has been defined!

Regards,

Ev, W2EV

JIM

EXCELLENT question... that I brought up as a wish/desire in the past... that if you didn't hear from a plotted object/station within a time "window" it

would gray out... and then at a second time threshold it would disappear... example... at two hours no new packets.. a plotted object/station would have it's icon go to gray... after 24 hours it would disappear from the screen....

Didn't result in much in the way of comments or feedback (other than a comment from one author that it would be implemented in the next version... and that's a half dozen versions back).. but hey... I didn't pay a whole heck of a lot for the versions I use....

Still... glad to see someone else see's the benefit/utility...

Following responses for APRSdos:

> Should the map display fade out over a period of time? Or, should it just go  
> away from the display after some time? If so, what time is reasonable  
> before the fade begins or it disappears?

APRSdos fades any old STATION or OBJECT to dark gray 2 hours after last receipt (or time of OBJ/STN)

> If removal is not automatic, should the  
> operator be able to remove a "stale" object?

Yes, APRSdos lets stations kill any Station or Object from the map. But if the originator is still transmitting it, then it will re-appear

ALSO, there is a format for "Killing an object from everyone's system". This can only be done by the originating station of that Object.. Although anyone can take over reporting responsibility for any object, and once he has the responsibility, then he can kill it too... This is so someone else can globally kill someone else's long-dead object...

Once killed (in APRSdos), it still remains in all lists, but is marked as

a KILLED object...

> How would a user be able to know the age (since last transmission) of  
> an object? How is it handled in other programs????

All Objects have a time stamp. (You are right, that you dont know when such object was actually received last, unless you also keep a TIME HEARD). APRSdos used to keep both times, (ORIGINATORS TIME STAMP) and HEARD TIME STAMP). But since 50% of everyone's PC's were on the wrong date, time or time zone, I removed this about 3 years ago and now only keep one time stamp...

Bob

YES....

> However, we ALSO have "destination callsigns" (page 13) of ALL, QST and CQ.  
> Which are we talking about?

The former. The fact that we also include ALL, QST, and CQ in the "destination callsign list" is for backwards compatibility to conventional packet where CQ, for example is the default CALL for some TNC manufacturers and QST is used often from SAREX and MIR for BEACONTEXTS... We added ALL just as a third possibility...

> Further, it would seem that there is no functional difference between a  
> bulletin and a "message to ALL". Since (page 59) "Users must be alerted on  
> arrival of a new bulletin or announcement", does not a bulletin have the  
> required effect, making the "ALL-message" superfluous?

Here is the difference in APRSdos.

When an APRSdos user gets a new message, whatever he is doing is interrupted with an overlaid MY MESSAGES window. He must look at this before he can return to what he is doing. Thus almost guaranteed assurance that he reads his mail instantly.

When APRSdos gets a new Bulletin, he only "hears" "QST" in CW (once). And from then on, after each human keystroke (after every 15 seconds) the letter "B" is also sounded in CW. Thus, he is alerted to arrival of a new Bulletin, until he reads it, but it is not thrown in his face...

Hope that helps show the difference.

Few comments. Also note I am only speaking my impressions on these issues.

Jim Wagner wrote:

> My points concerning permission vs requirement of certain APRS operating  
> conditions seems

Maybe I am oversimplifying things, but haven't you been asking for both a protocol document AND a operations guide? That in fact, your suggesting these two documents NOT be joined at the hip, so to speak? To me, it seems more the analogy between the FCC rules ("protocol") and the ARRL operating guide. Seems like a good division, if that is what you are suggesting. Is it?

> to have stirred a bit of a hornet's nest. Mr. Bruninga  
> alludes to the possibility of not "approving" my software if it does not  
> satisfy the conditions he deems necessary for emergency operation

So what? There are already a number of "unapproved" versions of APRS compatible display programs out there. You might not be invited to sit on the APRS-WG, but if you can live with that, code away. I'm not suggesting you NOT be compatible with the spec, but I also don't think this is going to make or break your product. You need to recognize a unfilled need, then fill it, for any product to be successful. This has already been borne out by more then one "uncertified" APRS compatible product (in fairness, I'm sure most of them will be become certified once

it is available.... but the point is you don't have to wait for the APRS-WG to do something).

> (thus,  
> disallowing use of the trademark "APRS").

Bob OWNS that trademark. It is his to do with as he pleases... if he doesn't like the color of your car, or the fact you prefer pencils over pens, he doesn't have to license it to you. Its his.

I think your confusing the label "APRS compatible" with "APRS". The WG will issue the "APRS compatible" certifications, while Bob will continue to hold the trademark on APRS. Or so this is how it has been explained in previous documents posted on the TAPR web site.

So, if you want to market a program called "Jim's ham AVL system" and added the logo "APRS-WG certified" you'll need to seek the approval of APRS-WG. The commitment for this procedure has already been put into place. But, if you want to call your program "Jim's EasyAPRS" then you'll need to seek approval from the trademark holder of APRS.

> More importantly, just what are the standards for approval for use of the  
> trademark "APRS" and who sets those standards?

Bob does. He owns this. Nothing to do with this list or the APRS-WG. If you want to license it, your best bet is to contract him directly.

> As I hope I have  
> pointed out, its not THAT hard to create something that appears fairly  
> compatible, and do it in such a way that it is attractive to users but not  
> call itself exactly "APRS".

Which has already been done. But your confusing a right of ownership, that is, the trademark to APRS, with compatibility to a over the air protocol. Two different and distinct issues.

Or am I completely confused here (not that I wasn't already)?

-Jeff

Hello to the group,

I would like to know if the "Spec" will include or support  
the use of the: Federal Information Processing System, "FIPS" codes.  
These codes are used by NOAA and EAS for addressing specific messages  
to counties and states.

These codes could help stations with filtering of APRS  
messages.

Paul

Hello group -

There seems to be a small omission in the diagram titled "Object Report  
Format - with Lat/Long position" on page 45.

One of the possible occupants of the 7-character field following the Symbol  
Code is the "Tyy/Cxx" Area Descriptor. Thats not listed in the diagram as  
one of data types which can occupy the field.

Many thanks and best wishes to all....

The FIPS code that I refereed to came from the FCC 1994

"Emergency Alert System", E.A.S., plan (FCC 47 CFR

Part 11.21, "State and Local Area Plans and FCC Mapbook").

State and Territories FIPS codes are listed in this section

of the rules, with Counties listed in a document called

"FCC Map Book".

The FCC used location codes from: "The U.S. Department of

Commerce National Institute of Standards and Technology

publication 772".

I have done a bunch of work with FIPS codes and could support them  
very easily, one of the reasons we did not do much with them is not  
easily readable by people because it is all numbers...

If I understand correctly, these are very US specific codes. Are they  
used anywhere else ?

These are of course OK as an optional feature, but I guess that the  
rest of the world would protest if these features would be \_required\_  
for some kind of APRS certification.

> [...]

Yes, the APRS protocol document is, in some sense, a specification of the  
APRS protocol plus all sorts of prescriptive language about how the  
user interface ought to work plus some implementation suggestions.

In the long term, I believe that attempts control the user interface  
(e.g., an APRS station must generate this sort of alert on reception  
of this sort of packet) will be difficult. I believe that a lot of  
users want control over these features (e.g., want to turn them off),  
and I believe some developers will address these desires.

Again, I think that the APRS protocol specification, user interface  
"requirements", and implementation suggestions ought to be clearly  
separated. Personally, I believe that this objective would be much  
easier to achieve if more than one document were created.

I believe that it would be useful for the APRS protocol spec to define several classes of APRS stations (e.g., GUI station, tracker, weather station, etc.) and identify the behavior that is expected of each of these classes of APRS stations (e.g., trackers probably don't need to ack messages, [or, then again, maybe they should to prevent the sender from needlessly retransmitting...]).

While it is another topic altogether, good conformance tests or certification tests are very difficult to develop, even for a mature, very precisely written protocol specification. Long ago I was associated with an X.25 certification test. After we pulled out the X.25 Recommendation

and argued a while about whether "may" meant the DTE could decide or the DCE could decide, the certification organization (the DoD, I think), more or less threw up their hands and admitted that we had pretty good X.25 software.

I also believe that things work better if the conformance or certification tests are derivative and the protocol specification primary.

Yes, Tim, I think this is a good suggestion. It will help discriminate

the issues and keep us from arguing to the lowest common denominator...

Other classes might be TELEMETRY station, DIGIPEATER, HF GATE, and IGATE... any others?

Greetings -

As many of you know, I am in the middle of creating a new APRS program. This has lead me to look at these descriptions very carefully, because that is all I have to work with (plus, of course, the great comments here on the list).

In the section on Objects and Items, the very first paragraph includes the sentence:

Object reports are identical to posit reports, except that the Position

Report is preceded by a fixed 9-character Object name.

I don't think that is true. A position report can include wind direction and speed in the Extended Data field but I don't think that this is allowed for Object. Conversely, an Object can include an area descriptor in the Extended Data, but I don't think that a position report can. Or, am I wrong?

In the description of the Item Format, it says:

Items are the same as APRS Objects, except that the Data Type Identifier is a ), there is no time stamp, and the Item name is variable length from 3 to 9 bytes followed by the standard ! format position.

But, is it really the same as an Object? There is no mention of including an area descriptor for Items, though it would seem to make sense to do so.

Related to this, here are some questions about Objects and Items:

- (1) Why no "Killed Item"?
- (2) To Kill an object, what degree of match is required? Name only? Name and position? Name and position and extended data? Name and position and extended data and comment?
- (3) What degree of match is required for an Object/Item replacement to occur? Name only? Name and position?
- (4) Is altitude coding allowed in comment text for Object/Item?

The latter question leads to the following suggestion:

I would like to see a short chapter on the data that can be embedded in the comment field. Examples include altitude and beam heading and position. There are probably others, but they tend to be scattered and buried, making them difficult to pick out unless you are a very careful reader. If you are simply trying to answer the question: "What do I need to specially decode from the comment field?", it's hard to find.

Thanks to everyone, and specially the Technical Editor, Ian Wade, G3NRW, who have made this all possible.

Greetings everyone -

Very brief question, I hope: Since the Object icon is used to denote an "area", how is the icon for an area to be designated? By the SSID, perhaps? If so, that does not leave much choice!

For example, I can see that it would be very desirable to use an area descriptor for a hurricane. Yet, there are no weather-related SSID-specific icons.

Many thanks -

Jim Wagner

In the note just sent, I inquired about specifying the icon for an area object. I asked whether or not one needed to fall back on the SSID.

But, now I read at the bottom of page 15 that if there is a symbol code present, the SSID must be ignored as far as icon representation is concerned. If that is so, then not even SSID is available to tell us what icon to use for an area. Or, am I missing something (again)?

Many thanks, again,

Jim Wagner

Think of an OBJECT as 100% identical to a position report. You just take off the 9 character call, and then continue parsing it as if it were a posit. This is intentional. It allows an OBJECT to be anything a station can be. Thus you can place WX objects, Moving objects, DF objects, ANY station on the map that cannot report his own position for some reason.

> In the description of the Item Format, it says: >

Yes. Again, wanting to keep everything as general as possible, an ITEM is also 100% identical to a POSITION or OBJECT. The only difference is that it has a variable length name and no time. Once you get to the LATITUDE, from there on it is 100% identical to an object or a position...

> (1) Why no "Killed Item"?

You can. The KILLED object format will KILL any matching HAMED Object, station or ITEM. Doesn't matter... That's why we ask that the software only permit the "originator of an OBJECT" to be able to send out the KILLED OBJECT for that "named" object/item/posit...

> (2) To Kill an object, what degree of match is required? Name only? Name  
> and position? Name and position and extended data? Name and position and  
> extended data and comment?

A KILLED OBJECT is only a "replacement" object that is marked as "killed". It typically has the same object data but with the killed TYPE character. Thus it stays on everyone's list (for future reference). But it only ceases to be displayed. The assumption being that NO ONE can ever completely cause other's data to vanish. It is simply marked for "no-display" so the other stations still have a copy in case it later becomes important.

Or, think of it as simply a "replacement" In this case, only the CALL has to match.

> (3) What degree of match is required for an Object/Item replacement to  
> occur? Name only? Name and position?

NAME only. and CASE does matter...

> (4) Is altitude coding allowed in comment text for Object/Item?

SURE. After the first digit of LATITUDE, all of these are identical...

> I would like to see a short chapter on the data that can be embedded in the

An area is an area. It just draws the shape. There is no ICON associated with it. Have you ever run APRSdos? 90% of your questions would be immediately obvious if you just tried them in APRSdos...

If you want to draw an area around a hurricane, you just do the normal HURRICAN input and then add anotehr object for the "area" you chose...

<snip>

Yes. I've used APRSdos, WinAPRS and APRS+SA. Each has different strengths and weaknesses. I believe at this point it would only be common sense to be thoroughly versed in all these (as well as the proposed protocol) before attempting to create another application, even if using a different operating system. After all, trying them is free.

I'd hope for something that combines all their strengths and avoids their weaknesses.

Hello Group -

On page 49 of the draft, the following appears:

In addition, where the raw data has been post-processed for example, by the insertion of station location information), the four position Data Type identifiers !, =, / and @ may be used instead. In this case, the Weather Report is identified with the weather symbol /\_ in the APRS Data.

A little later, where "Weather Reports with Time and Position" are discussed on page 51, it says:

Examples of report formats are shown below. Note that the Symbol Code in very case is the \_ (underscore).

The format description leaves the Symbol Table ID character undefined. And, in fact, the Symbol Table on page 84 shows that

/\_ = Weather Station  
\\_ = Weather Site

The question IS:

Should the reference to "weather symbol" on page 49 include both the "/\_" and "\\_" symbols? Or, should the format description on page 51 be restricted to a Symbol Table ID of "/", only?

Many thanks,  
Jim, KA7EHK

Good question. The combination of "complete" and "positionless" weather in the APRS standard is a bit of a mess, since the resulting "weatherless" position packets necessary to fill in the positions for the "positionless" weather also contains the WX ICON. Thus on receipt of a position packet with the WX icon, your software has to check the WX fields to determine if this is in fact a "complete" WX report or a "weatherless" position packet by context parsing.

This could be solved by using a different ICON for "complete" WX reports and for "weatherless" position reports, but that will have to be an issue for a later rev of the spec...

Good luck, Bob

On page 19, in a brief discussion of the contents of  
the comment field, the draft says:

As special cases, the Comment field can also contain:  
i The bearing and number/range/quality parameters in a DF report.  
i Storm data.

It does not say (anywhere in this section) that the comment  
field can also contain altitude coding (page 23):

Altitude in Comment Text ó The comment may contain an altitude  
value, in the form /A=aaaaaaa, where aaaaaaa is the altitude in  
feet. For example: /A=001234. The altitude may appear anywhere  
in the comment.

This seems to me to warrant inclusion not only where it is but  
ALSO in descriptions of the Comment Field. My reasoning is  
this: suppose someone (sort of like me) comes along and asks  
"What special things do I need to watch for in the Comment  
Field?" Unless that same person just happens to catch it  
elsewhere in the docs, it will be missed.

Many thanks,  
Jim, KA7EHK

Sorry to shoot the messenger, Earl, but...

Is this consistent with the APRS Protocol Reference?

The spec says:

"It is recommended that APRS interprets at least the following  
NMEA Received Sentence types:

GGA ...  
GLL ...  
RMC ...  
VTG ...  
WTP ..."

(First, I assume that the sentence should read something like: "APRS  
stations SHOULD interpret the following..."; I believe that the term  
"APRS" is too vague to be used in an unambiguous spec.)

The spec indicates that no conformant APRS station needs to interpret the  
\$PGRMZ sentence. Sending a packet that implementations aren't expected  
to interpret doesn't seem wise.

I believe the spec may be silent on whether an APRS implementation may  
transmit in formats that are not described in the spec, (beyond the "{"  
user-defined format and perhaps the "" test format).

The spec does say that

"Altitude may be expressed in two ways:

- o In the comment text.
- o In the Mic-E format."

Personally, I believe that an important objective of a protocol spec is to promote the development of interoperable implementations. I also believe that an important test of the quality of a protocol spec is whether it is precise enough to ensure that conformant implementations interoperate.

It appears to me that a spec that permits an implementation to transmit whatever formats it chooses is unlikely to be effective in fostering interoperability.

Is the \$PGRMZ listed in spec, but I missed it?

Does the spec need to be more precise in what formats an APRS station may transmit?

Does this new feature conflict with the spirit or the letter of the spec, at least to the extent that, as a non-standard (proprietary) extension, it makes interoperability difficult?

-tjs

Tim, maybe I'm wrong, but I do not think you understand. WinAPRS is not transmitting \$PGRMZ, it is Interpreting \$PGRMZ and then including Altitude in the on-air transmitted data in APRS format. This is Good Tim. It then provide 3D position, Track and Speed. It is a melding of RMC and RMZ. It does not harm intra-operability at all. I hope you can recall your bullets. Keith will correct me if I'm wrong, then you can shoot me. Brent KH2Z

Neat.

I stand corrected.

Greetings -

On page 24 of the draft, we have the following:

#### Wind Direction and Wind Speed

The 7-byte DIR/SPD Data Extension can be used to represent the wind direction and sustained one-minute wind speed in a Weather Report. The wind direction is expressed in degrees (001-360), clockwise from due north. The speed is expressed in knots. A slash / character separates the two.  
For example:

220/004 represents a wind direction of 220 degrees and a speed of 4 knots.

If the direction and speed are unknown or not relevant, they are set to 000/000.

Now, for the question:

Is the Direction/Speed extension ALWAYS present if the symbol is  
/\_ or \\_ ????. If not, how does one distinguish between Direction/speed  
and (other) weather data. Is the presence of the "/" in character  
four of the extension field sufficient (when the symbol is /\_ or \\_)  
????

Many thanks,  
Jim, KA7EHK

Hello, again (and again, and again...)

The draft (page 27) seems to suggest that Bearing and  
Number/Range/Quality is present ONLY after course/speed data.

Is this a correct interpretation?

Thanks,

Jim, KA7EHK

Thats the problem I referred to in supporting both the weatherless  
position data and the positionless WX data. In APRSdos, I use the  
presence of the "g" and "t" fields as the "test" to determine if it is  
truely WX or if it is just a pposition report of a WX station without any  
WX data associated with it. SO, yes, the CSE/SPD/gust and TEMP fields are  
REQUIRED. If any are missing, then it is probably a WinAPRS weatherless  
position report of a WX station...

Does anyone out there have an electronic copy of the NMEA-183 spec? I have portions of it in printed form, but I'd like to see the whole thing. I'm reluctant to fork over \$75 to NMEA just to peek at their spec. The notes I have indicate that wind speed is reported as an instantaneous velocity, relative to true north, in knots (MWV). I don't know if this is directly related to some recent postings I've read, but it seems that it would be difficult to extend the APRS spec beyond what NMEA defines.

Hello Group -

Very recently, I asked whether the symbol characters  
"/\_" and "\\_" were BOTH recognized as indicating a  
Position Report with weather.

Bob responded with some very important information, but  
didn't answer the question. So, I will pose the question  
again.

Does the presence of ANY symbol with a Symbol Code character  
of "\_" in a Position Report make it a "Weather Report"? Or,  
is this true only for symbol "/"\_ (Weather Station)?

Many thanks,  
Jim, KA7EHK

All of the following may contain WX in a complete report  
/\_ , \\_ weather station  
/W , \W NWS weather station

In both casses of the alternate "\" symbols, these symbols may have an overlay character such as R for a RADAR site, "N" for a site that can also do WIDEn-n digipeating or "T" for sites that are TRACE only. etc...

In other words, the alternate symbols are just normal overlay type symbols, but are still treated the same...

Can someone tell me what the APRSDEV list is? I see no mention of it at all on the TAPR list server. How does one gain entry to it?

Thanks

Jeff

Hi Hamish:

Hamish Moffatt wrote:

> My understanding is that BPSK mode in PSK31 has some FEC,

> but QPSK mode has more (since it has theoretically twice the bitrate).

I went back and checked, and I'm fairly sure there is no FEC in the BPSK mode and 2:1 FEC in the QPSK mode. So the actual user speeds are the same, with the 2X speed improvement of QPSK being taken up with

FEC overhead.

Now, I took a look at the varicode tables, and came up with this for a good set of short chars for representing digits (which will comprise the bulk of transmissions i.e. being lat/lon).

The proper PSK31 representation of digits actually is quite long... 8 to 9 bits.

| Char  | Length | Could be? |
|-------|--------|-----------|
| SPACE | 1      | 0         |
| e     | 11     | 1         |
| o     | 111    | 2         |
| t     | 101    | 3         |
| i     | 1101   | 4         |
| a     | 1011   | 5         |
| n     | 1111   | 6         |
| l     | 11011  | 7         |
| r     | 10101  | 8         |
| s     | 10111  | 9         |

So for example, your "APRS" broadcast station would send the station's callsign (in standard varicode), then a delimiter, then the lat/lon in a compressed code (in this case the shortest varicode letters).

Or another way would be to go with "two digit" representations. Represent 0-99 as an ASCII char from 0-99.... I think the average is around 8-9 bits, so you be at least be getting close to matching BCD. So let's say for example you want to represent lat 42.3397. This could be represented as "+!a" in varicode (you drop the decimal place and stay with fixed length). Or even better, offset the varicode by 32 to take advantage of the shorter length of the lowercase letters.

The other advantage of base 100 (as above) is that you drop the waste of two "00"'s between each varicode char.

Or dump varicode altogether, but that might limit initial interest.

Just some thoughts.

-Jeff

Hi All-

I am in the process of changing the Data stream coming from the WXSVR  
parser and need you to add some more call signs to your "Stations.txt" file.  
An explanation is located at  
[http://kg5qd.home.att.net/I\\_gate.html](http://kg5qd.home.att.net/I_gate.html)  
This system is more versatile and can be taylorred to your local area.

73 de kg5qd Dale

> IGATE... any others?

A handful of thoughts:

- o Somewhere I started a list that included trackers, GUI stations, non-GUI stations (e.g., HamHUD), stand-alone weather stations, ...
- o It is probably difficult to develop a meaningful list of station types; it probably makes sense to make a list of functions that a station might support. For example, it is probably easier to say that a station contains HF Gateway, Internet Gateway and Digipeater functions than it is to specify a digipeater, a digipeater with IGate function, a digipeater with HF Gate functions, etc.
- o It may make sense for the spec to read along the lines of "If an APRS-compliant implementation supports this function (e.g., telemetry), this is the way it ought to work..."

- o My guess is that, when it comes down to it, there is no function that all APRS stations need to implement in order to conform to the spec. For example, compare an [APRS compliant] tracker with an [APRS compliant] weather station; I suspect that there is no protocol feature that they must both implement. (Anyone should feel free to make up a bunch of examples to support this assertion, if there is any question...)

This is one of the best tests of the quality of a protocol specification:  
for people to implement from the spec and then test their implementation  
against other implementations for interoperability. It would be really

nice if you wrote up your experiences with the APRS spec when you are done.

(I believe that one of the Pascal standardization efforts (the British Standards Association or some such thing, I think) insisted that only features that had been implemented in a single-pass compiler could be included in the language spec. Contrast this with some language specs that contain features that either can't be implemented or that people can't figure out how to implement in a standard fashion.)

By the way, you may also want to look at the various streams of APRS packets available from [www.aprs.net](http://www.aprs.net). This will help you learn about features not in the APRS spec, such as deprecated features, and some not unusual, but rather odd-ball, packet formats (such as packets that intermix TNC-2 and Timewave/AEA MONitor command output formats).

Hi, Bob... Rob here. (The CE guy.)

I was playing around with messaging on my CE version, and was sending messages to my dosAPRS station downstairs. The dos station has been running unattended for many moons, and had lots of messages and bulletins in the buffers. My messages to my station downstairs were being answered with REJnnn packets. What causes this? (I looked in the spec under messaging, but it's not mentioned. Or, I should say, I didn't see it.) My guess is that the arrays were full, so it was acknowledging the fact that it received the message but was unable to store it. (Right?)

Should this be included in the spec? (My guess is "yes.")

Thanks,

-Rob

Yes, good point. Although all the other APRS versions seem to have unlimited message storage capability, APRSdos does not and resorts to REJ instead of ACK packets. Yes, this should be included in the SPEC in my opinion. IN fact, Kewnood should also have included REJ algorithm since it can only receive 16 messages before it begins losing un-read msgs.

The beauty of it is that noone has to implement it, except the writer that has limited memory. The "sender" software doesn't care, since it will ignore the "REJ" and just keep assuming that the message is undelivered...

I just purchased a Kenwood TM-D700A. It is a new dual-band mobile unit that is APRS ready. When used in the APRS mode, there appears to be no way to interface the radio to an external computer. I had hoped that the serial port would send data to an external device. I could use it as a simple TNC with external control software, but the available APRS software doesn't support this device. Does anyone have experience with this radio?

Rich Carter - KE1EV

Bob,

The D700 does send REJ replies. One of the local D700's was responding with REJ packets. We dug into it to figure out why (and why they went away when he cleared all his messages). This was my guess. It turns out it's documented in the APRS section of the manual. If the messages haven't been read, it won't scroll them off the queue.

Hello again, everyone.

On page 53 of the draft, Storm Data is discussed. It seems to imply that storm data can be included in (weatherless) standard position reports.

I would like some clarification as to the starting position of the storm report. Does the course and speed occupy the "data extension" field and displace anything else that might otherwise be there (such as PHG)? Or, does it follow the data extension field?

When parsing such messages, how can storm data be recognized as distinct from plain comment text? If display symbols are either /@ or \@, can the presence of storm data be "guaranteed"? If these symbols are absent, can it be guaranteed that there is NO storm data?

Many thanks,  
Jim, KA7EHK

Follows it. Since the storm usually has a cse and speed

Data may or may not be there. But if data is there, I only look for it if  
it is a /@ or \@

I think it might be nice if the APRS Protocol Description contained language  
similar to:

"All position data SHOULD use the WGS-84 datum."

(I was wondering when this would come up.)

((I was also wondering whether the APRS Protocol Description should  
recommend that APRS stations should try to average their position over  
time, rather than simply copying latest NMEA string. Of course this  
quickly gets more involved for moving stations...))

Interesting point... But what would users in parts of the world that  
don't use WGS-84 do? For instance all mapping in the UK is based on  
OSGB-36, and GPSs bought in the UK are configured to that datum.

Datum translation would be required for every posit transmitted and received.

```

Unfortunately the datum issue becomes more and more complicated when more and more DGPS services become available or if the SA is removed from the satellites. Currently the random errors due to SA and other errors sources are in the same order of magnitude as the difference between different coordination systems.

There is no problem as long as all persons involved in an operation are using the same datum, but does everyone know what datum should be used and how to setup in their own equipment? It is quite likely that equipment will be set to wrong datum and wrong types of maps are used, so there are real possibilities that search and rescue operations may fail due to this.

If an operation extends over a national border, it is quite likely that a different datum is used in each country and a physical point that is visible on many overlapping maps may have different coordinates depending on in which country (and in some cases even when) the map was printed. Adding to this confusion a generic GPS receiver will report the coordinate in WGS-84. The Maidenhead locator system should also be based on WGS-84, according to recent IARU Region 1 recommendation.

I think that the APRS 1.0 document should at least contain a warning about the confusion about coordinate systems. Possibly also recommend that the WGS-84 should be used, but if not possible due to e.g. maps in different systems can be used and at least recommend how all

participants in an operation should agree of which datum to use.

It might be a good idea to recommend that the full resolution format e.g. 07201.75W should be used only if it is in WGS-84 and the true resolution is 10-100 m and that the less accurate format e.g. 07201.7\_W should be used for an other datum, even if the position is known to a 10 m precision. This would reduce the risk of misunderstandings in the field.

One issue that should be addressed in some future version of the APRS standard is the inclusion of a orthogonal position format. In many countries local maps (e.g. 1:20000) are printed using some orthogonal coordinate system based on the UTM (Universal Transversal Mercator) or Gauss-Kruger system, in which a central meridian is selected and coordinates are reported as distance from the equator in meters and the (east/west) distance in meters perpendicular to this central meridian.

APRS has always assumed WSG84. But then APRS was originally a USA only software. It is a tough issue.

I think though that we could simply list in the spec the "standard DATUM" for each "country" as a baseline reference. This way, everyone could then make the same "assumptions" as to what they are seeing.

For APRS version 2.0, we could look for a BYTE to add that would indicate the datum...

There are really two issues here. The datum used should match the datum of mapping software used to display target position. If correct target vectors are to be computed, targets need to use the same datum.

On the surface, it might appear that this is not an issue, given large errors

introduced by selective activation. It has been my experience that GPS position reported by commercial receivers can be off by as much as 1/10th mile. This error may appear small, but may cause confusion if it were used for search and rescue operations. I haven't verified this, but I expect that the range and bearing from one target to another tends to be correct, assuming that both use the same datum, and neither uses differential correction. Extending the spec to include datum sounds like a wise plan. Who knows where APRS is headed.

BTW: For marine applications, GPS precision is marginal without it. I use a differential receiver, and I have noticed that they are becoming much more common. JRC makes a nice self-contained DGPS sensor at a very reasonable price. Raytheon, Furuno, and other manufacturers also have competitive products.

Bob,

Would not it be easier to have APRS use a single datum worldwide. This would reduce the burden on implementers. Rather than having to implement converting many datums to many other datums they would only need to implement a conversion of the standard datum to the other datums.

I believe NMEA specify a datum to be used.

Also there are arguments discussing whether this is really even an issue.

GPS has an error around that of the different datums. APRS should not care how we get a position. Maybe people use loran, maybe people set their transmitters on top of geodetic markers. Either way it should show on the correct place on the map.

Just my \$.02

Charles

Comments mine not those of my employer.

Forgetting about GPSs for a moment, and looking at the basic practical  
issues involved in this:-

If I look up my location on a map in the UK, then the latitude and  
longitude I read off the map is referenced to OSGB-36. If someone in  
another part of the world does the same thing, then the latitude and  
longitude they read off their map is referenced to another datum.

I don't really think that anyone can seriously be expected to apply a  
Molodensky transformation to convert what they read off the map to  
WGS-84 before they put it into their software or TNC BTEXT!

Also, if my position referenced to OSGB-36 has an error of 100m or so  
when referenced to WGS-84, what practical difference is that going to  
make? (Unless you're planning to try and drop a cruise missile on my  
head! ;-) The only map data detailed enough to show the error is also  
likely to be referenced to OSGB\_36...

I've been avoiding this because it's likely to get me in a lecturing mode. If there's interest in selecting and using the appropriate datum, I'll be glad to get up on my soapbox, or at least refer you to a couple of well-written pages explaining what, why, etc.

I support Tim's suggestion that all collected data should be common, and for a variety of good reasons, WGS-84 is as good a selection as NAD-83. The problem is, most of the map basis we have for basemaps, Tiger files, are in NAD-27. In my particular area, the delta is about 120 m between NAD-83 and NAD-27. In another area of Texas I've looked at, it's on the order of 200m, and in a third, it's less than 10m.

What we need to do is go in search of newer basemaps, and develop new APRS maps from those. Specifically, we should be using maps based on NAD-83 or WGS-84 datums.

> ((I was also wondering whether the APRS Protocol Description should  
> recommend that APRS stations should try to average their position over

No. There's a couple or 5 good reason not to do this, not the least of which is, thanks to SA (it's still around!) and systematic errors, your average could well be off.

At the risk of sounding like an idiot, what are the five good reasons,  
not to average position?

Looking at my gps3 display it does seem to be a zero mean process.

I thought that the expected error with selective availability was zero  
mean.

More SA meant more variance. Less SA meant less variance.

COMMENTS: MINE NOT EMPLOYER.

Charles

I've got a solution for the datum issue.

Lets just rename APRS to AMERICAN Packet Reporting System. ;-)

(with due apologies to Canada and Mexico)

-Jeff

AHA! We can do that but then we'd have to standardize on NAD83, which was developed in concert with the geodetic organizations of Canada, the US, Mexico and most all of Central America.

NAFTAPRS would be an acceptable compromise! 73 de Rod,VE1BSK.

Three years ago, I asked the same question about the Datum of APRS SIG. There was no definitive answer back then. I was thinking about making DeLorme Street Atlas USA available for APRS use, and it used WGS-84. Fortunately, more GPS receiver default output to WGS-84, so it was not a major issue. However, I discovered that some online maps such as MapBlast, used by the APRS+SA web server, a feature copied by APRServe and recently by WinAPRS, uses NAD-27. So with these web based maps, you may find that you are not exactly where you think you are, complicated by Selective Availability (SA) of course. APRS+SA's web server does perform a transform of data to NAD-27, and assumes the on-air data is in WGS-84. APRS+SA allows for the entry of Lat/Long in more than 100 map datums, and converts the data to WGS-84 for transmission.

Brent Hildebrand, KH2Z

APRS+SA  
<http://www.tapr.org/~kh2z/aprsplus>

There seems to be a compliance issue among some of the APRS programs and the APRSspec item "position ambiguity". This came up a week or two ago on the SIG, and all that was said was that it was part of the spec. Fine, but this "APRS-SPEC" doesn't help much if people don't write compliant software.

Being I'm of the mind that navigation is a life and death issue, I think this might need to be addressed by the APRS-WG. In particular, a list of non compliant applications should be published to head off any potential liability issues. This should include both the present APRS trademark licenses as well as compatible programs.

-Jeff

P.S. We now have a off the shelf radio, PLUG and PLAY, so to speak, supporting APRS, made by a major amateur manufacturer. This manufacturer, in good faith, wrote their software to be complaint with a pre-release version of the APRS-SPEC. Yet at this late date, apparently even some of the core applications are still not complaint. Call me all the names you want, but as soon as someone dies because their posit is displayed 1000 miles in error, you'll wish you either had a disclaimer or were compliant with the very spec you are writing.

P.P.S. Advance apologies if this has already been fixed or its actually a Kenwood problem. Its just the second time this has come up in the last two weeks and I know at least one application was still non compliant in December of 1999.

I had the great opportunity to visit with 30 or so APRS folks this  
afternoon. I had a chance to see a variety of APRS machinery in operation.

One of the stations was sending ?ping? queries to another. I asked where it

came from as I did not recognize it from the draft specs. He said that it was part of dosAPRS.

So, the question: where is it? Gone? Overlooked?

Thanks,

Jim Wagner

IM not sure. It was there back 8 years ago as a do-nothing packet. Just a way to send a packet that would NOT get interpreted as anything but did allow you to test packets on theair. I have not supported it in years, yet I get ?PIING? messages from folks often. So it must be some other version doing it. I dont know what the proper response is supposed to be...?

SPEC group...

When we made the list of allowable AX.25 DESTINATION calls, I extracted out of APRSdos the ones that I thought were generic and could be justified to you guys. But over the years, APRSdos had collected over 31 such specific generic calls that I have seen used with specific UI type data and wanted to capture.. So they are in APRSdos, but only the more obvioius ones made it into the spec...

Well, we forgot one. Its in APRSdos, but not in the spec.. It is TEL (for telemetry). What we put in the spec was TLM.. I figured that is what the PACSATS use... so why not standardize on it...

Well last weeks launch of STENSAT I just learned uses the call of TELEM. So, fortunately APRSdos users will see the packet, but a fully compliant

software IAW the spec will not, without disabling ALTNETS. So I recommend we add TEL... to the spec...

Of course if STENSAT turns out to not turn on (in 3 days when it is supposed to, then it is a moot point. But if it does turn on... ARGH!!!

YIKES, the Kenwoods wont decode it!!! I wonder.... Sheesh.....

Yep, just tested it and the kenwoods dont include TELEM either...

Gosh, I sure wish the builders of satellites (on the same campus as I am) would have ASKED me first.... I was not even aware of the project until after it was in the can!

The good news is that the Kewnoods can receive it by changin to the ALTNET call of TELEM... (An then NOT forgetting to turn back afterwards)...

Bob

Subject: [aprssig] STENSAT

APRSdom...

I am happy to report that the STENSAT telemetry was built with a modified MIM and therefore the telemetry will be APRS decodable! So when the satellite is deployed on Wednesday, we should be able to capture it with your APRS software and more importatnly with your Kenwood Radios!

I have no more info at this point. You will be the first to know when I find out the telemetry equations... and activation times...

de WB4APR,Bob

StenSat's telemetry should be APRS compliant. It is a TELEMETRY packet with a "T#" preamble:

N4AFL-1>TELEM<UI C>: T#000,255,004,037,129,032,010 STENSAT PICOSAT

where the Telemetry numbers are (in order):

Sequence number - goes to 255, then rolls to zero

Power supply monitor  
Current monitor  
Temp monitor  
2.5 volt reference  
Current RSSI value  
Three light sensors (low value means light is striking the sensor):  
Light sensor values are (in order):  
Flat face (3 by 4 inches)  
Long side (1 by 4 inches)  
Short side (1 by 3 inches)

Bob

I know the goal is to squeeze every last byte out of transmissions... but TLM and TEL are no where near as clear as TELEM...

Since you are throwing proposal issues on the table.. can I second that TELEM be the "standard".... it's a whole lot LESS AMBIGUOUS than the other two .... the cat is sorta outta the bag now... no?

Yes, remember these are all right-wilcarded, so TEL will accept TELEM...  
yet still allow for other subsets....

WinAPRS implements ?PING? exactly the same as ?APRST which is Trace route.  
Therefore ?PING? is kind of redundant since ?APRST does the same thing.

I just joined the list today so I am late to the table and may have missed any discussion on this. However, I searched the list and found no post on this subject. Sorry if this is old news.

On page 12 of the APRS Spec (Draft Version 1.0.1g: 3 December 1999) -- Flag is defined to be the bit sequence 0x7F. I believe this should be 0x7E

-Mike

Yup, I don't know what I was doing when I typed 0x7f ... I've only known it was 0x7e since 1983 ..... :-))

It will be fixed in the next release.

It sounds like it might be worthwhile to rethink how the destination  
AX.25 address is used APRS. In particular, how to make whatever use is  
made of this field extensible.

(By the way, I started thinking about all of the international call signs  
that might conflict with the generic call signs...)

> So they are in APRSdos, but only the more  
> obvious ones made it into the spec...

Will APRSdos be upgraded to conform to the spec once it is finalized?

> YIKES, the Kenwoods won't decode it!!! I wonder.... Sheesh.....  
> Yep, just tested it and the Kenwoods don't include TELEM either...

[Insert long diatribe about the evils of hard-coded rigs, TNCs, and  
just about anything else that implements a communications protocol here.]

?APRST is in the spec, but ?PING? is not.

What are you proposing?

To change the spec?

To upgrade WinAPRS?

To let the spec and WinAPRS diverge?

I am not proposing anything

?APRST is the official SPEC version, I had ?PING? in a long time ago to be sort of compatible with the ?PING? that Bob had. I have not gotten around to removing it.

As I stated above, in WinAPRS, "?PING?" and "?APRST" currently do the EXACT same thing. I don't see any issue here. I can easily remove PING if needed.

Mark

I'm confused by this response. Are you indicating each and every member of the WG had to go through this process? That is, that they specifically had to "ask to join the WG" in a message to a member of the WG?

I think not....?

In any case, I don't see anything in the charter about "asking" to join. Can you please quote me the section in the charter that requires perspective new members to "ask" to join?

In fact, reading the charter, it appears quite the opposite of what you are saying here. The charter clearly states that new members may only be made upon motion of a current member. I see nothing about "asking to join".

Hey, I have an idea here that will fix the WG oversight regarding these two authors..... why don't \*you\* make a motion to the WG that Roger and Frank be nominated for membership? Then if they decline to

accept this nomination, this issue is closed. IMHO, it seems to me the section of the charter that talks about membership is intended to allow members of the WG to nominate new members that they feel can make a positive contribution. Clearly, both of these people have made positive contributions to APRS and would broaden the experience base of the WG. Does the WG disagree with this?

Irregardless of if or if not either of them "asked to join", I think it would be in the WG's best interest, and ultimately APRS, to have European representation as well as "open development" mindset type folks on the WG. This is very important now that the WG is moving past documenting the present protocols, and will hopefully start looking at extensions to APRS as well as the "Big picture" as Bob outlined in an earlier message.

Regards,

Jeff

Hello, again...

I am really curious why the ".PARM" and other telemetry support packets were made so pointedly "non-APRS"?

Clearly, the capability of one station to beacon "for" the actual telemetry sender is useful. But it would seem that a better format, say, akin to message addressing, would allow standard APRS network filtering to be applied.

Thanks,

Jim Wagner

What is non-APRS about an APRS message? The telemetry formats and  
equations (usually transmitted after the fact) are in "standard" APRS  
message format.

Just take a look at the bottom of page 54. It says:

Note: These beacons are not APRS Bulletins ó they are ordinary UI  
beacon  
text frames, and do not have any APRS Data Type Identifier.

Jim Wagner correctly pointed out that the spec has the TELEMETRY  
PARM,UNITS,EQNS, etc packets wrong. The SPEC implies they are unfomratted  
AS.25 "BEACONS", when in fact, they are standard APRS MESSAGE FORMAT.  
Thus they look like any other APRS message.

Ian, we will need to fix this in the spec...

bob

I'm working on java code to decode a MIC-E packet. First, if someone has done this already I'd love to see it!

Second, I'd like to know about quirks that I should be aware of. It seems there may be some early MIC-E units that do things a little differently? I've read the APRS draft 1.0.1 many times to create this code but I'm just not completely sure what I'm missing.

Here is what I have so far. Constructive comments would be welcome.

file: MIC\_E.java

```
/*  
    MIC-E class takes a valid binary MIC-E AX.25 packet and decodes the  
    payload.  
*/
```

```

import java.util.*;
import java.text.*;

public final class MIC_E {
    private final static String[] MESSAGETEXT = {
        "M0/Off Duty", "M1/En Route", "M2/In Service",
        "M3/Returning", "M4/Committed", "M5/Special",
        "M6/PRIORITY", "M7/EMERGENCY",
        "C0/Custom-0", "C1/Custom-1", "C2/Custom-2",
        "C3/Custom-3", "C4/Custom-4", "C5/Custom-5",
        "C6/Custom-6", "C7/EMERGENCY" };
    private static SimpleDateFormat UTC;

This is VERY interesting, I am glad you are doing this..

I would be more than happy to work with you on this.. Also, this discussion should probably be moved to the APRSSPEC list.. I am copying that list with this reply.

A good baseline might be to consider the AMSAT formats used. I dont have the data in front of me but it may be extensible beyond 8 bits. IT can certainly handle up to 255 channels. And even if it is only 8 bit, then all it takes to do up to 16 bits is just define two adjacent channels for the LSB and MSB. The format was just XX YY .... repeated over and over where XX is the channel number and YY is the value in HEX with space delimiters. The value of this is that not every value has to be present in every packet. Some values can be repeated much more often and slowly chanigng values less often... And the packet can be any length.

Disadvantage is that you have 50% overhead by specifying the channel number all the time.

Or, I think the 9600 baud birds use a format of straight binary, with the number of bytes to follow and then a stream of contiguous channels. This is more compact if you are sending every channel every time, but if you dont need all the channels all the time, then this too has inneffeicencies...

just some thoughts.

I got a couple of pointers for the MIC-E question I posed. Looks like WA4DSY has tackled this problem and his code provided some information that may need to go into the documentation.

The code is fairly complex and I'm not certain I read his code correctly but it seems that REV 0 (beta) units provide the following differences:

- o Longitude does not use the +100 offset bit
- o Longitude does not subtract 80 when between 180 and 189
- o Longitude does not subtract 190 when between 190 and 199
- o Speed value does not subtract 800 if > 800
- o Course value does not 400 when > 400
- o No table indicator (defaults to /)

o Symbol may be non-printable (if so its given as \$)

Can anyone confirm or deny this information?

I'm going to attach the newer version of the java class file in case anyone wishes to play with it.

Jonathan, could you provide us with a pointer to DSY's code?

Thanks

The telemetry values, as I read the spec, are ASCII numeric characters.

There is no rational reason to limit the value to 255. A value of 999 takes no more ASCII characters than the value 255 does. This does NOT solve the problem of values with more than 9 1/2 bits (well, a little more since 10 bits is equivalent to value 1023).

Base91 could easily extend this to 753570 (which will accomodate 19 bits and some - B7FA2 hex - if I understand Base91)

This does not quite solve the 24-bit A/D question posed by Paul (K17JG). Perhaps two fields would handle that without any protocol changes (using Base91).

Jim, KA7EHK

Upon re-checking I have found it was Alan Crosswell, N2YGK who wrote the original mic\_e.c decode software (my apologies).

It is available as the file "mic\_e.c" inside aprsdigi from:

<ftp://ftp.tapr.org/aprssidig/linux/aprssidigi-2.0-pre3.tgz>

WA4DSY modified it to compile cleanly under g++ and that is available as the file "mic\_e.cpp" from:

<ftp://ftp.tapr.org/aprssidig/linux/aprstd210.tar.gz>

Finally, I have rewritten it to run under Java, added altitude support and am trying to figure out how ambiguity is encoded and that will be available when done from either tapr or sourceforge. However, I'm in the middle of moving home to England (Weybridge, Surrey) in the next couple of months.

I have read the MIC-E protocol up and down a few times but I'm still stuck on the position ambiguity decoding.

For latitude it seems simple enough. You have six 4-bit nibbles which normally could have a value of (in theory) 0-9 but I would assume when position ambiguity is used that nibble has a value > 9. Easy enough to code  
-- when that nibble is > 9 then substitute a space. Am I on the right track?

Now I look at longitude. Its easy enough to compute but position ambiguity doesn't seem to be done the same way so I am at a loss. I want to make sure my Java class can correctly convert a MIC-E packet into a good position report but this bit (ok, bad pun...) has me stuck!

I'd also like to find some test data. The TH-D7 I have doesn't seem to support that feature so I can't use it for testing.

I building a simple KISS TNC based on the Atmel AVR.

I'm having problems with the packet decoding.

I can decode the destination address in the AX25 frame  
I can decode the source address  
I can decode the path WIDE, Relay etc....(The example below has no path)  
By changing single chars in the message I can change single chars in the  
decoded packet below.

Then when I get to the Data portion it is all garbage.  
It looks like the data is subject to a data scrambling pattern.  
(Common is lots of communications for 1 to 0 balance)  
If it is I can not find it in either the AX.25 or APRS specifications.  
What am I missing?

Sample packet:  
Sending to KL7JG-6 from KL7JG-7 ( a THD7A)  
Message TEST?ISIT.WORKING

The captured packet in HEX:

<FLAG>

41 50 4B 30 30 31 30 4B 4C 37 4A 47                   =(APK0010L7JG)  
A0 F7 01 78 9D 25 A6 1B A5 A3 16 1B 10 10  
1D AD A2 29 AA 9F A4 A9 24 2A 97 AB 27 A9  
A5 24 A7 A3 3D 99 86 1F 12 <FLAG>

Any Ideas?

What am I missing?

I've tried thing assuming I was off by one bit.... I get tantalizingly close  
but nothing works.

Paul (K17JG)

                                                      ^^  
                                                      ^^

> A0 F7 01 78 9D 25 A6 1B A5 A3 16 1B 10 10  
  ^^  
  ^^

> 1D AD A2 29 AA 9F A4 A9 24 2A 97 AB 27 A9  
> A5 24 A7 A3 3D 99 86 1F 12 <FLAG>

Note this two-byte sequence: 47                    A0  
which is, in binary               : 0100 0111 1100 0000  
note five contiguous 1's         :                ^^^^^^  
so, delete this bit               :                    ^  
and continue decoding.

This extra bit was presumably inserted on transmission; it should be removed on reception.

See paragraph 2.2.6, Bit Stuffing, in the AX.25 2.0 spec  
(<http://www.tappr.org/tapr/html/Fax25.html>), which says:

"In order to assure that the flag bit sequence mentioned above doesn't appear accidentally anywhere else in a frame, the sending station shall monitor the bit sequence for a group of five or more contiguous one bits. Any time five contiguous one bits are sent the sending station shall insert a zero bit after the first one bit. During frame reception, any time five contiguous one bits are received, a zero bit immediately following five one bits shall be discarded."

(Note that the second sentence should read: "shall insert a zero bit after the fifth one bit.")

> A5 24 A7 A3 3D 99 86 1F 12 <FLAG>

Ok, I was wrong last time.

First, it appears that the characters in the AX.25 call signs are not appropriately shifted left one bit. So, looking at the first 12 bytes, I get (manually, so there are probably some mistakes):

| Was          | Should be    |
|--------------|--------------|
| 41 0100 0001 | 82 A To Call |

|    |           |    |                       |
|----|-----------|----|-----------------------|
| 50 | 0101 0000 | A0 | P                     |
| 4B | 0100 1011 | 96 | K                     |
| 30 | 0011 0000 | 60 | 0                     |
| 30 | 0011 0000 | 60 | 0                     |
| 31 | 0011 0001 | 62 | 1                     |
| 30 | 0011 0000 | 60 | reserved bits, ssid=0 |
|    |           |    |                       |
| 4B | 0100 1011 | 96 | K From Call           |
| 4C | 0100 1100 | 98 | L                     |
| 37 | 0011 0111 | 6E | 7                     |
| 4A | 0100 1010 | 94 | A                     |
| 47 | 0100 0111 | 8E | G                     |

After that the pattern isn't so clear...

My bit stuffing was/is fine.

My problem was in the part that seemed to be working.

I was decoding the Address field fine, but the data field was scrambled.

So I did not look in the specification for the Address field.

AX.25 section 3.12 says all the Address fields are encoded shifted one bit high.

Since I got the address field to decode correctly I did not look there for my problem.

I was off by one bit from the beginning of the packet.

I missed the 0 that always seems to follow the flag bit.

I was detecting that as the end of the flag, not the start of the next char.

Thus my address decoded fine, but I was off by one when I got to the data.

Who would have guessed that

APK0010KL7JG should not be encoded as APL0010KL7JG

I originally discounted off by one bit, because the data did not look like it was shifted. It was harder to find than I thought it would be.....

Assume you have the ASCII text ABCD

Encodes as hex 41 42 43 44

Encodes as binary 01000001 01000010 01000011 01000100

So if you are off by 1, one would expect

|    |          |          |          |          |
|----|----------|----------|----------|----------|
|    | 10000010 | 10000100 | 10000110 | 1000100X |
| 82 | 84       | 86       | 88 or 89 |          |

BUT it is sent on the wire LSB first..... so it actually encodes as

10000010 01000010 11000010 00100010

Then off by one gives

00000100 10000101 10000100 0100010X

And transposed back to human ordered form again

|          |          |          |          |
|----------|----------|----------|----------|
| 00100000 | 10100001 | 00100001 | X0100010 |
| 40       | A1       | 21       | A2 or 22 |

So the pattern 40 A1 21 A2 is only shifted one bit from 41 42 43 44

I used a lot of graph paper to figure this out, then I wrote several simple C programs to read in a set up numbers and spit things out again shifted variable amounts..... My head hurts.

I hope this post was an appropriate use of the group bandwidth.

I always enjoy seeing how people go about solving problems.

One of my pet peeves is when someone solves a problem they asked about on a list and then never tells the group what worked.

If you don't think this was appropriate let me know via private mail.

Paul (K17JG) knee deep in the bits...

Are you sure that you have the correct number of data bits? And, are  
treating parity correctly? And, correct number of stop bits.

All these things can create the sort of pattern-errors you have observed.  
Incidentally, I am REALLY interested in what you are doing with AVR. Which  
one are you using? Is this for a commercial product or will the code be  
available?

Many thanks...

In article <LYR14779-67103-2000.02.21-15.52.34--Ian.Wade#care4free.net@lists.tappr.org>, Jonathan Bradshaw <jonathan@nrgup.net> writes  
>I have read the MIC-E protocol up and down a few times but I'm still stuck on  
>the position ambiguity decoding.  
>

Jonathan, which description of the Mic-E protocol are you reading? Every description I've read has significant errors/omissions/misleading statements in it, which I've attempted to correct in the APRS Protocol Reference.

>For latitude it seems simple enough. You have six 4-bit nibbles which normally  
>could have a value of (in theory) 0-9 but I would assume when position  
>ambiguity is used that nibble has a value > 9. Easy enough to code  
>-- when that nibble is > 9 then substitute a space. Am I on the right track?

Take a look at the table at the top of page 38 of the APRS Protocol Reference (draft version 1.0.1g, 3 December 1999). This is the definitive and correct definition of all the possible legal latitude values. The position ambiguity character (space) occurs when the ASCII address character (after right shifting one bit) is "K" or "L".

[BTW, be very careful about using raw nibbles to define the latitude values. This works OK if the Message A/B/C bit is "0" or \*standard\* "1". But it does \*NOT\* work if this bit is \*custom\* "1". In that case, you need to subtract 1 from the nibble to get the latitude digit. This is where most of the earlier Mic-E documentation fell down.

For example, if the incoming ASCII character is "G", the corresponding hex value is 47, so the second nibble is 7. You then need to subtract 1 from this to get the latitude digit: 6.

If I were implementing code, I would use a table lookup approach, based on the table at the top of page 38. This way you don't need to think about special rules, and it would probably run faster].

>  
>Now I look at longitude. Its easy enough to compute but position ambiguity  
>doesn't seem to be done the same way so I am at a loss.

Position ambiguity is not specified in the longitude value. The longitude position ambiguity is assumed to be the same as the latitude position ambiguity, as defined above. (This is not made clear in the Protocol Reference -- I will be including a statement to this effect in the next release).

P.S. I assume you are also aware that for longitudes up to 9 degrees the longitude offset bit (+100 degrees) is \*set\*? This has caught out at least one other software developer).

Yes, someone needs to build a test file.....:-(

Bob

Let me say first that I am certainly thankful that a spec was finally delivered - kudo's to those who worked hard to make it happen... and I think the results are starting to show with some of the Super questions here - involving developing projects ..

Bob's comment about a test set brought on this posting...

Is a revised document imminent? What's next - the test set? Extensions? Any feedback about the future would be greatly appreciated..

Thanks again for the effort..

NO, NO, NO, NO !!!! This is exactly where early documentation was incorrect/incomplete/misleading.

For the reason I stated in my reply to Jonathan earlier today, that algorithm O-N-L-Y works if the Message A/B/C bit is a "0" or a S-T-A-N-D-A-R-D "1".

See the table at the top of page 38 in the spec.

If you receive a letter "J", the corresponding hex value is 0x4a; i.e. the second nibble ("a") is > 9. However, this is NOT an ambiguity space, it is latitude digit 9, BECAUSE THE MESSAGE A/B/C BIT IS A \*\*\*CUSTOM\*\*\* "1". THAT IS, WHEN THE CUSTOM "1" BIT IS SET, YOU HAVE TO SUBTRACT 1 FROM THE NIBBLE TO OBTAIN THE LATITUDE DIGIT.

I repeat: you should study the table on page 38 for the COMPLETE AND ACCURATE definition of valid latitude characters. Earlier documentation didn't say anything about how to handle bytes containing CUSTOM message "1" bits (or glossed over it very briefly and misleadingly), and many people seem to be unaware that you don't treat such latitude digits the same way as for bytes containing STANDARD message "1" bits.

If it's any help, I've just scribbled away for a few minutes in QBASIC to  
produce a very quick n' dirty program to decode the MIC-E destination  
address. Enter the 6 characters of the address and the program will tell you  
the latitude, longitude offset, E/W and the three message bits. (It's a  
perfect example of a well-designed structured program incorporating all the  
latest object-oriented techniques, serving as a model for java/xml  
implementations ---- NOT! :-))

>Whats Next?

One thing that will be worked on and then submitted to this group is the Hurricane data.. The current documented implementation is not complete.

Another thing that will be worked on is Shelter information. There is a LARGE push on this from the people in Florida including the American Red Cross.

On both of these, we (those that have interest in this that are pushing me) will figure out 'workable' solutions and then post them here for comment etc, following the procedures put forth by the APRS Working Group charter.

Ian,

Qbasic is cruel and unusual punishment for some of us. Much easier in many modern development environments to mask and shift the bits as needed rather than dealing with a lookup table.

Thanks for the Qbasic example, it will keep me from yearning for the 'good old days'. <grin>.

I'm sure users who still use qbasic will benefit, however.

Bill KC9XG

I've been remiss in not posting an update recently. Sorry about that.
We had a huge batch of corrections, suggestions, etc., from the comment
period, and that, combined with real-life work conflicts for a couple of
folks, has slowed down the final revision. But Ian is working on it, and
I hope the final release won't be delayed too much longer.

By the way -- the comments received have been very helpful, and incorporating
them will make the final Protocol Spec a much better document.

73,
John N8UR

I know, I know! It's cruel for me too -- I haven't written real code for years now :-)) As for table lookup, my early programming days in the mid 1960s were (mis)spent on radar and real-time process control apps, when machines were very slow and we had to squeeze every ounce of speed out of 'em. There weren't enough machine cycles available for all that new fangled bit shiftin' malarky, so table lookup was the only way to go, and old habits die hard. I won't let it happen again!

Ian,

Thanks for posting the QBASIC code to the list. It's very helpful in
describing how the decoding is done- even if other programming languages
may be more efficient.

Hi,
I'm just reading the spec draft. Good job.
I'm writing a soft for ELT search and rescue. In France, ham are the only
terrestrial radioelectric research team for aircraft disaster.

I was trying last year to understand the aprs message format, but it seems so
confusing for me than I preferred to develop my own protocol. The draft you've
published was more understandable. Then I will add a compatibilty with aprs
messages.

But I've some remarks/questions:

page 21: what is the datum for all the coordinates? Is it WGS 84? The NMEA is based on the WGS 84, then I think it's better to use the same for the aprs message. The same coordinates in another datum could cause errors up to 1000 meters from the real position.

page 25: How was choosed the power step? The important thing in knowing the power is to calculate the attenuation path to have an idee of the range. This is proportional to a log scale. Why not use a log scale in the choice of the power step? There is 6 db between 1 and 4 watts; 3 between 4 and 9; 2 between 16 and 25; 1 between 25 an 36, 2 again between 49 an 64, 1 between 64 and 81... Very strange...

What is the antenna gain reference. Is it dBi, dBd or dBj (japanese dB especially on comet antennas HI) ?

Everywhere:

For the differents lenght units, I know that you are well attached to the imperial units, but as you know, there's an International System Unit standard which recommand the use of meters instead of feet and miles. Maybe a translation of the different constants in the two standards and the addition of the unit in the messages will internationnalise your protocol.

Good work and 73.

Patrick, f5orf

Sorry guys. Although I promised not to post any more QBASIC, I'm on a roll now!
Here is
a complete QBASIC program to decode the destination callsign and the longitude,
speed
and course. I know the coding is kludgy, but I really wrote it to check out
certain
things for the APRS Protocol Spec.

As far as I know it works OK. However, if you find any bugs, please let me know.

Hint: Log some IGATE output, then look for the Mic-E transmissions. Very often a
Mic-E
station transmits a conventional posit just before/after the Mic-E transmission,
so it's
possible to correlate the two.

```
~~~~~  
~~~~~  
  
REM  MICDEC.BAS  
REM  A QUICK N' DIRTY MIC-E DATA DECODER  
REM  by Ian Wade, G3NRW (g3nrw@arrl.net)  
REM  29 February 2000  
REM  
REM  Decodes the 6-byte destination callsign, containing:  
REM    Latitude, North/South bit, West/East bit, Longitude  
REM    Offset, Message Code.  
REM  
REM  Decodes the first 7 bytes of the Information field:  
REM    APRS Data Type Identifier, Longitude, Speed, Course.  
REM  
REM  Understands Position Ambiguity (minutes and hundredths  
REM  of minutes).  
  
REM  Error handling in this simple demo program is rudimentary  
REM  and far from bombproof.  
  
REM  Input the destination address and Information field in  
REM  the right format and the program will work. Input it in  
REM  the wrong format and it probably won't.
```

```
REM NOTE: If ANY of the Message A/B/C bits is a Custom-1, the
REM message is a *Custom* message, EVEN IF ANY OF THE
REM REMAINING BITS HAPPENS TO BE A STANDARD-1.
```

```
REM NOTE: This program does not support Rev 0 beta units.
```

While implementing the symbols in my new APRS program, the following questions have appeared:

Symbol "/#" - Digipeater (white center)
what does this mean? Does it mean green star (as in "\#")
but with a white center rather than overlay char?

Symbol "\W" - NWS Site (options) [w/ overlay]
what does "(options)" mean?

Symbol "_" - Weather Site (green digi) [w/ ov'lay]
what does "(green digi)" mean?

Symbol "\i" - Indoor short range digi [w/ overlay]
Does anyone have any suggestions about the symbol?

Symbol "\a" - ARRL ARES etc.
Is a particular symbol expected here?

Symbol "/"&" - HF Gateway

Folks in the Pacific NW US seem to be using diamond with

A number of the symbols are very difficult to represent graphically. These include "hail", "smoke", "freezing rain", "haze", "earthquake", "snow shower" (as distinct from "snow"), "rain shower" (as distinct from "rain"), "blowing dust/sand", "fog", etc. Are there any thoughts about representing these?

My apologies folks.

I have a new keyboard and I am hitting some (unknown) key
which causes messages to be sent from the Yahoo mail
composition page.

Symbol "\d" DX Spot by Callsign - what is anticipated here?

A DX symbol with the callsign next to it? Is the callsign
in addition to the callsign of the station originating
the symbol or does it substitute? How is the callsign
specified? I don't see it in the protocol specs anywhere.

Symbol "\c" Civil Defence (RACES)- is this expected to be the

circle with a triangle symbol (that used to say "CD" in the center of the triangle)?

Thanks very much for your patience,

Jim Wagner, KA7EHK

Anything you want using one of the overlays
>
> Symbol "_" - Weather Site (green digi) [w/ ov'lay]
> what does "(green digi)" mean?

Its a WX symbol but green to show it is also a digi

> Symbol "\i" - Indoor short range digi [w/ overlay]
> Does anyone have any suggestions about the symbol?

Yes, its a square box that a character can be overlayed on.

>
> Symbol "\a" - ARRL ARES etc.
> Is a particular symbol expected here?

A for ARES, R for RACES, etc

>
> Symbol "/"&" - HF Gateway
> Folks in the Pacific NW US seem to be using diamond with
OVERLAY. Yes, the diamond with overlay is the more general.

See APRSdos. All of thsoe are displayed using the standard NWS weather
symbols. Dont think in terms of "icons" That is only dirven by WInAPRS
and Bill Gates. The symbols can be much more general than that.

bob

Yes, but the field is defined, so you need something to put in it.

Yesterday, I posed several questions, one of which
was:

> Symbol "\." Unknown or indeterminate position - if the
> position is unknown or indeterminate, then there is
> no position information which will allow it to be
> positioned on a map
>

Bob Bruninga responded:

Yes, but the field is defined, so you need something to put in it.

With all due respect, this is a program-specific response.
Maybe HE needed to do that, but it does not mean that anyone
else has to.

Thanks,

Jim Wagner,
KA7EHK

No it is not. There is a field in APRS for the SYMBOL. You CANNOT LEAVE

IT OUT. If you have an unknown or indeterminate position, then you must still put SOMETHING in that SYMBOL field. The definition of a UNKNOWN or INDETERMINATE position symbol is provided for that case. There is nothing program specific about that.

Bob

This response shows how easy it is to confuse even familiar terminology
when it is not explicit.

I thought that the reference to "field" was to a data display field in some
APRS program. Bob clearly (after the clarification) meant a field in the
APRS message.

Cheers,

Jim, KA7EHK

Hi Jim,
Ain't it the truth! :o) I was a bit confused myself, but was happy to
see the clarification.

I can't count the number of times that an eMail misunderstanding has
resulted in an unnecessary firestorm (and even gotten sucked into a
couple myself, quite inadvertantly).

It reminds me of a "double translation" that was run on a text file.
The sender couldn't speak Russian, and the intended receiver couldn't
understand English. The sender sent the text through a language
translator. Then, just to be safe, ran the translated text back through
a Russian to English translator. The results were
fascinating...including a phrase that started out as "out of sight, out
of mind" that ended up as "invisible, insane".

Keep smilin' folk! :o)

Warmly,
Ev Tupis, W2EV

Hello, all -

I posed this back on Mar 2, and I don't think anyone bit. It does seem to be fairly important because it appears to imply information that is not in the protocol. So, here goes, again:

Symbol "\d" DX Spot by Callsign - what is anticipated here?
A DX symbol with the callsign next to it? Is the callsign
in addition to the callsign of the station originating
the symbol or does it substitute? How is the callsign

specified? I don't see it in the protocol specs anywhere.

The most important issue here is: if it is to have a callsign label (other than the sender's call), how is it specified. Is this really an "object"????

In fact, page 8 carries the following statement which I honestly do not see:

"DX Cluster Reporting - APRS an ideal tool for the DX cluster user. Not only is it possible to see all DX spots on the map, but by operating in the monitor-only mode, the overall packet load on the DX cluster is reduced. This is a benefit to everyone on the channel."

Could someone please explain???

Many thanks,

Jim Wagner

A symbol is just a symbol. Say you are a DX fiend and want to appear as a DX on the map, just enter that symbol. Many versions of APRS have the ability to receive and interpret DX spots on the map, but this protocol is defined by the DX cluster folk, not APRS folk...

"By callsign" in this case means that the position was derived from the international list of callsign locations, and was placed on the map according to that general position, not by any other means. That is why APRS includes a position ambiguity indicator all the way up to the nearest deg (60 miles) or 10 degrees (or 600 miles).

What dont you understand? Putting DX spots on the maps?
Or how one APRS object packet instead of 50 copies and 50 acks is a
benefit to the channel?

Bob

For another 2 cents, the definition of that "symbol" is a "DX spot whose position was estimated based on its callsign prefix". Nothing more or less than that is implied. If you have DX information that was not gained by the use of the international list of callsign prefixes and the country they belong to, then do not use this symbol. Use any one of the other 350 symbol possibilities as appropriate...

Concerning the following - I did not understand HOW DX "spots" are to be placed on a map, hence how they could be of any use to DX cluster users.

Thanks for the explanation. That answered my question (somewhat). Do I understand properly that "DX Spot" is an object or item symbol?

The following question still remains. How is a country prefix transmitted?
Is it THE OBJECT NAME??

Furthermore, if as Steve says, its NOT part of the APRS protocol, then why is it in the APRS symbol list??????

>> "DX Cluster Reporting - APRS an ideal tool for the DX cluster user.
>> Not only is it possible to see all DX spots on the map, but by operating in
>> the monitor-only mode, the overall packet load on the DX cluster is
>> reduced. This is a benefit to everyone on the channel."
>>
>> Could someone please explain???

It is a symbol. It can represent anyone or anything, even a vehicle.

>The following question still remains. How is a country prefix transmitted?

>Is it THE OBJECT NAME??

>

In general, DX spots are transmitted on a DX cluster frequency, using
their own separate protocol. APRS programs that can interpret this

protocol, and correctly place the spots on the map, often use the same icon to display them as the APRS DX icon, but there is absolutely no requirement that they do so. This is a user interface issue, not something covered in the APRS protocol.

If someone were to develop a DX Cluster to APRS gateway, the best way would probably be to turn the DX spots into APRS objects, and use the APRS DX symbol. However, no one has done this to the best of my knowledge. The programs that interpret DX spots do so using the native DX cluster protocol.

>Furthermore, if as Steve says, its NOT part of the APRS protocol, then why
>is it in the APRS symbol list??????

>

You still seem to be hung up on the concept of 'symbol'. A symbol is simply a bitmap that gets drawn on the screen of a user's computer at the request of another station. By convention, certain symbols have certain meanings, but they are not necessarily markers for particular protocol types.

So any station may choose to display on users' maps as a DX. If my name was Dimitri Xavier I might be particularly enamored of it. I could use it driving around in my truck if I wanted to. If I was a DX hound, I very well might like to use it for my home station as a "vanity" icon. I'm not a DX hound, I use a Macintosh computer, so often I use the Apple symbol, I live on an island so when I'm in the Keys I use the IOTA symbol. My Mac icon does not mean that I transmitted my position in a Macintosh protocol, only that I chose that symbol to represent my position. The IOTA symbol does not mean I transmitted an IOTA position format. Anyone can choose any symbol they want, though there are certain conventions, such as the star for digipeaters.

Yes

> The following question still remains. How is a country prefix transmitted?
> Is it THE OBJECT NAME??

It is not transmitted. You use a local database built into all versions
of APRS that support this function...

> Furthermore, if as Steve says, its NOT part of the APRS protocol, then why
> is it in the APRS symbol list??????

The symbol IS in the protocol.
DX spot decoding is in Mac/WIn/APRSDos and others, and all kenwood
products if it is not in the APRS spec, then it is a serious omission from
the spec that should be fixed...

We may be having a symantics problem here. I agree with Steve that we can plot any DX station on the map using any of the hundreds of APRS symbols, but the symbol identified in the SYMBOL.TXT file as a "DX SPot by callsign" should only be used to indicate a "DX-Spot-placed-on-the-map-in that-location-using-the-process-of-callsign-prefix-database-lookup".

It should not be used except in accordance with its definition. Probably what we need then is a more general "DX" Icon also that can be used freely by anyone at anytime to indicate anything they want about "DX"...

I think this would solve this issue..

Bob

I disagree. The DX cluster protocol was not developed by APRS authors, is
not maintained by APRS authors, and does not belong in the APRS protocol
document. Any APRS program or device is certainly free, and even
encouraged, to support other protocols, but they do not belong in the
APRS spec.

Ok, I understand Steve's assertion that "DX Spot" symbol
can be used as a vanity symbol, just like MacAPRS, etc.
I don't see any problem, there.

What does confuse me, and continues to, is the terminology
in the (draft) spec symbol table:

"DX Spot with callsign"

The term "with callsign" is not used with any other symbol.
Thus, there must be something special here.

WHAT IS IT???

Thanks,
Jim, KA7EHK

I have just completed writing a new program that encodes Mic-E data for manual input to a TNC. This will be particularly useful in HF APRS, allowing the use of much shorter packets than normal.

Here is an extract from the documentation:

=====
MIC-E PACKET ENCODER
=====

Mic-E format is one of the formats that APRS uses to compress position, course, speed and other information into very short packets. This can be specially helpful in HF, satellite and meteor scatter communications, where received signals are often weak and deep in the noise. Clearly, the shorter the packet, the greater the chance that it will be received successfully.

In the extreme, Mic-E formatted packets can be as short as 27 bytes (plus flags). See the APRS Protocol Specification for full details of how this is achieved -- the current release of the specification is draft version 1.0.1g, dated 3 December 1999, available at <http://www.tapr.org/tapr/html/Faprswg.html>.

Traditionally, Mic-E formatted packets are generated by firmware, in units such as the Mic Encoder and PIC Encoder, and also in the Kenwood TH-D7 and TM-D700 radios. However, it is also possible to transmit Mic-E packets using just a plain TNC and radio, without any special Mic-E firmware. The trick is to encode all the required position and other information into suitable UNPROTO and BTEXT commands. Doing this by hand is a lengthy and error-prone job, so the MICENC program was written to automate the process.

=====

MICENC Features

=====

The MICENC program encodes a station's position and related information into Mic-E format, suitable for entering into a TNC as UNPROTO and BTEXT command strings.

The input data includes:

- * Latitude (with position ambiguity if required)
- * Longitude
- * Message Code (for Standard, Custom and Emergency messages)
- * Speed
- * Course
- * Symbol Code (with overlay where permitted)

The program outputs the:

- * 6-character UNPROTO string (AX.25 Destination Address), containing the encoded latitude, message code, N/S indicator, W/E indicator and longitude offset.
- * 9-character BTEXT (AX.25 Information field), containing the encoded longitude, speed, course and symbol code.

While most BTEXT strings will contain printable ASCII characters, some will not. MICENC highlights unprintable characters -- unfortunately most TNCs will not accept such characters as input. (Note: This is a TNC restriction. Mic-E compatible firmware will handle all valid Mic-E characters, whether printable ASCII or not).

MICENC also supports keyboard/display logging to disk, allowing the data to be examined at a later date.

MICENC is available from <http://www.netro.co.uk/aprs.html>

Keyboard/Display Dialog

When entering data, the MICENC keyboard/display dialog looks something like this:

```
~~~~~  
Latitude (e.g. 1234.56N) or 'Enter' to quit: 5157.96N  
.....Longitude (e.g.12345.67W): 00029.39W  
.....Message Type (M=Std, C=Cust, E=Emerg): M  
.....Message Code (0-6): 2  
.....Speed IN MPH (0-920): 0  
.....Course (0-360): 4  
.....Symbol Table (P=Primary, A=Alternate): A  
.....Symbol Code (1-94): 13  
~~~~~
```

```
MESSAGE = /M2/In Service SPEED = 0 knots  
SYMBOL = House HF          OVERLAY = (none)
```

```
cmd: UNPROTO U1UWYV  
cmd: BTEXT `v9C1  -/  
      123456789
```

```
1=digit one  l=lower-case L  I=letter I  0=digit zero  O=letter O  
~~~~~
```

The first section shows the input of the station's latitude, longitude, message (standard, custom or emergency), speed, course and symbol code (from the Primary or Alternate Symbol table). The program understands position ambiguity and symbol overlays.

The second section plays back the message, the speed in knots and the symbol/overlay in plain English, then displays the UNPROTO and BTEXT strings that correspond to the input data.

The digits 1-9 underneath the BTEXT string show the character positions -- this is a useful guide when typing the string into the TNC.

The last line of this section is simply for information, highlighting the differences between some of the characters that look very similar to each other.

In some cases the BTEXT string will contain non-printable ASCII characters. Unfortunately most TNCs will not accept these characters as BTEXT input. MICENC highlights them by displaying their character positions and hex codes. For example:

```
~~~~~  
cmd: BTEXT ` (>l >/  
      123456789  
***** WARNING: Unprintable ASCII char(s)  
Char #2 0x7F
```

Char #7 0x1C

Hi Jim,

Soon I'll have a better location here in Redmond. When I do, I'll be monitoring the DX Cluster folks frequency and develop some technology to cross post the objects to APRS. Since a DX spot for, for example, KA7EHK, doesn't have Lat/Long information, I'll have to get that from a callbook database - by callsign. These spots will use the "by callsign" object.

73,
Bill - WA7NWP

This may simply be an artifact of the ongoing difference of opinion about whether the APRS spec is a protocol specification or a protocol specification plus some other stuff like user interface recommendations or specifications.

We are not talking about the DX cluster protocol which is a very complex protocol. We are talking about the fact that APRS adopted the single line format for a DX spot (and only that) as part of its protocol. Because of this, Kenwood and APRSdos and Mac/WIn and maybe others then could all depend on the invariance of that definition to build to that common single line format.

To me, the recognition of the fact that APRS has adopted that single line format (APRS is a single-line-formatted-protocol) should be mentioned in the spec, just as we have delineated that APRS expects to parse a certain minimum subset of similar NMEA sentences.

Maybe our messages crossed, but I explained that in great detail in 2 previous messages.

Further, I disagree with steve. It is not a general purpose DX icon. It is very specific in its use and means only the one thing. I DO AGREE, that this disucussion has revealed the need for a more general purpose "DX" ICON that can be used more indiscriminantly.

Just to let everyone know, I have resigned my position in the APRS Working Group. If anyone has any desire to take my position, or has someone they think should be invited to join, I would suggest you contact the remaining members with your ideas.

I can see from the first 10 emails I've received I need to clarify this a little.

I am not leaving APRS, just the APRS Working Group. My database and XML projects will continue. The APRServe system will remain as it is.

Bob has accused me of being "anti-Bob" and impeding the progress of the APRSWG. I do not agree, I believe that my objections to protocol issues are based on my informed opinion, not personality. I do not feel Bob is "anti-Steve", I think he is arguing points based on his vision of APRS, and that we just differ greatly in our visions.

However, I recognize it is hard to be objective about such things. The fact is most discussions on the WG mailing list ended up being arguments between Bob and myself. We both have strong opinions, and neither of us is likely to change our minds. I do not want to be the person deciding the future of APRS, so perhaps it is best I stop trying to promulgate my vision. I do believe the APRSWG is important to the future of APRS, and that if you care about the future of APRS, you should contact members of the APRSWG with suggestions of who you would like to see included.

Long time APRSers know that I had specifically asked to be excluded from the APRSWG when it was formed. I was talked into joining by a number of other authors. I desperately wanted to see the WG formed, APRS opened up to other authors, and a protocol document produced. This has all happened, with the resulting protocol document being far better than I dreamed, thanks to the unexpected involvement of Ian Wade. His efforts produced an outstanding document, and I want to publicly thank him for

this effort. Had he not signed on, and put out an enormous effort, the document might still not have been released. The whole APRS community owes Ian a huge debt.

I understand that X1J digis send a fixed string at the beginning of the data, so that the "!" APRS Data Type Identifier may be shifted from its usual first character position (by up to 39 characters).

Can someone please tell me the nature of the X1J fixed string. What data does it contain? What characters can it contain? Must not contain? Examples?

I'm working on an APRS decoder program, and I need to know how to unambiguously recognize (and ignore) X1J strings.

> I'm working on an APRS decoder program, and I need to know
> how to unambiguously recognize (and ignore) X1J strings.

I'm not sure if this is the best way to do it, but in APRS/CE, I have the
main parsing routine check the incoming data for all "well-defined" strings.
The last thing it checks is for any '!' in up to the 40th position. For
each one it finds, it calls the posit parsing routine with that portion of

the string. If the posit parser fails to find a valid posit string, the whole string is treated as a status packet.

(Did that make sense?)

Authors,

You may have seen my uninvited musings about PACKET and the loss of the ability of many hams to even be able to hook up a TNC anymore. I rambled and sort of implied that anything digital is better than nothing.

What this leads me to here, is to wonder if we should not have specified

in the APRS spec, what an APRS station does when it receives a CONNECT REQUEST?

APRSDos clears the screen and puts you straight into a dumb terminal window. Thus, you can respond to someone else who only connected to you conventionally. I know some of you object to putting "operating" stuff in the spec.... But would it make sense to be part of the spec to suggest that APRS software should facilitate backwards compatibility to dumb terminal connectivity?

I'd lean that way...

But conversely, I would shy from any further snobballing such as to encourage file-transfer. That is a NO-NO on an APRS channel. But I think we kinda agree that KEYBOARD activity is tolerable for the purpose of temporary communications...?

This is not a call for action... Just a thought about what your software does when someone connects to it...

Bob

Bob's comments are worth while. We really do need to consider a variety of non-APRS situations in our applications, and this is certainly one.

WinAPRS/MacAPRS recognizes the connect and sends a message saying that it doesn't accept connects, and then disconnects..

Steve made some good suggestions about my Satellite OObjects. I now only uplink them as objects when they are in view, and I kill them when they go below the horizon.

The one other suggestion by Steve was to modify the APRS Speed field to accomodate orbital speeds. The primary reason is so that the objects can be properly dead reckoned. This is important since my one minute objects will not all get through... And if everyone dead reckons them properly, then I dont even need to sustain a 1 minute rate and can drop back to 2 minutes!

One EASY way to do this is to simply define all speeds aboove 975 knots to be converted to MACH numbers by subtracting 974. Thus 976 is for example MACH 2 and 999 is MACH 25 which is the speed of orbiting satellites. The ONLY place to make this conversion is in the DEAD-RECKONING routine. Just let the CSE/SPD vector still be interpreted as 999.

I'll look up the exact conversion for MACH numbers in KTS and will advise on monday. Or we could make the cut off be at 900 and then we can express speeds in terms of quarter-MACH numbers to give higher precision... Which I doubt we will EVER need..

Before you go spending alot of time on this, there already exists orbital prediction programs that can do a far better job then the system you are suggesting.

No, I don't expect you will see more than a couple of hits on
APRS, so orbital prediction is overkill.

I disagree. You need orbital prediction.

I was just suggesting their were already programs out there that could do this in a far better manner then what was being suggested.

Yes, APRStk is one of them. It can predict position and velocity of a
satellite to within about 1 degree in AZ/EL. But I would say that less
than 1 percent of THD7 HT users or D700 users have a PC with them in
their pocket or in their mobile.

My uplinking as objects of the 7 amateur satellites that are
workable by a THD7 or D700 is a way to let those users see where the birds
are without having to bother with a PC.

What are you talking about "hits"?

What we are talking about is uplinked Satellite objects need to have a realistic speed in their posit packet so that they can be deadreckoned on off the map if for some reason a follow on packet never arrives. We anticipate using digipeated POSITS for most of the amateur satellties includeing the ISS. None of the existing satellites have GPS, so one of the purposes of APRStk is to digipeat 3rd party posits for these satellites so that ground users SEE a posit and vector on their maps.

We used this during all the APRS/MIR experiments in 1998 and 1999. AND we will use it for any other APRS satellite. And we are using it daily in our locally uplinkied objects here to keep locals informed of passing birds...

Now that Position ambiguity is in the SPEC and is built into APRSdos, WinAPRS, APRS+SA and the D700, I think it is time to consider permitting it for THD7 users as well.

This is easy to do and has been built into APRSdos since the THD7 came out. Even if we do not codify it in the spec, other authors should consider implementing it.

Simply, any posit from a THD7 that ends in xxxx.00N/xxxxx.00W can be assumed to be ambiguous to the nearest minute. This assumption has a 99.99% chance of being the correct assumption.

The power of this, is that it lets handheld users of the THD7 keyboard in a POSIT at work and home and some favorite local places without having to carry a GPS unit everywhere he goes. And he will show up on the map as ambiguous to within a half mile of that location. Thus you can see about where he is for message purposes, but can also see at a glance that he is not using a GPS for precision...

During a recent test of the APRSdigi software I encountered a situation I dont know what to do with. I send it to the list in hopes of finding an answer.

Here is the received packet, which I heard direct from KE4KLD....
KE4KLD>APRSM,KF4HJW-10,WIDE3-3/0:=3719.31N/07719.00WMPHG5192/MacAPRS
3.2.6 -VA-CH_ENON -326-<04b>

APRSdigi sees that KF4HJW-10 does not have the * to indicate that it digipeated it.. so it basically just ignores it.

Should I ignore it by APRS digi standards, or should I digipeat it?

Thoughts:

I could HOLD the packet, and If I dont hear it digipeated in say 30 seconds... I could then assume that

1) I cant hear KF4HJW-10

or

2) KF4HJW-10 never repeated it for some reason (not heard, garbled, etc...)

Should I digipeat it then??? and If so.. should I change the original path, or not, and if so... in what way?

This is the first I have seen of this on APRSSPEC.. Is it using Keplerian elements like the other satellite tracking programs?

If not, there is some source code code on the www.amsat.org site that could help you here.

> But I would say that less

I didn't realize these devices could do dead reckoning. Remember, you were suggesting sending satellite velocity over the air, when in fact there is no need to do this if a device is smart enough to do some calculations on its own.

Do the Kenwood boxes have the ability to do dead reckoning?

> My uplinking as objects of the 7 amateur satellites that are

Thats fine. What does this have to do with "Mach numbers" and once again kludging a spec that has yet to be released?

When I first read the message, I imagined you were talking about a satellite passing through your listening view area. You might receive one packet (hit) closing in, and one packet opening out.

----- Original Message -----

> What are you talking about "hits"?

Yes. Its been out for a few months and talked about quite a bit on the
SIGS. It not only tracks the satellites, but also QSY's the kenwoods for
automatic operation with these 7 satellites and tunes for doppler..

Sorry, they cannot. But these objects show on everyones APRS maps,
and if you dont DR them, then they become stagnant erroneous plots.

> Thats fine. What does this have to do with "Mach numbers" and once again
> kludging a spec that has yet to be released?

We need a means in APRS to specify velocities greater than 999 knots. In
this case, 17,500 MPH to apply to amateur satellites for example.
Allowing speed values in excess of 975 be translated into Mach numbers
was just an idea to allow for specifying the full range of speeds that
might apply to APRS objects that would be backwards compatible to all
existing software...

OK, I looked into APRStk, and indeed it uses Keplerian elements. So it
is able to transmit (and see) a exact satellite position report and has no need
for dead reckoning.

Now, there are plenty of freeware satellite tracking programs, so anyone with
a computer (and who doesn't run APRStk) could use those and get much better
results then any kind of attempt at 3 dimensional dead reckoning.

So anyone running a computer, can run a satellite tracking program, and really
has no need to get posits over the air.

So that leaves stupid trackers, like the Kenwood products. Now I see no
reference if these do "dead reckoning" on the Kenwood Web page. Even if
they did, I'm sure this 2 dimnshional version of dead reckoning, which doesn't
recognize anything over 999 mph, and even if it did, would do a poor job

with anything that wasn't on the surface of the earth.

So why again are you suggesting the APRS protocol be modified?

Oh, I see. No, I guess since I have been running APRStk, I keep my map
on the 2048 mile range so I can see all satellites above my horizon, and
anyone's APRS packets that may be relayed by the satellites. I still zoom

in locally if anything happens there too...

Because it does not allow for Speeds of Orbiting APRS stations of which there are and will be many. We allowed for their altitude in the PHG equations, but overlooked their speeds.

Most MOBILE, PORTABLE and HANDHELD units don't have PC's with them. It is useful to them to post OBJECTS showing them the position of satellites that they can work. Such objects are moving stations, and as such need a realistic CSE/SPD vector.

Well, I don't understand why you want to modify the protocol then?
It won't benefit the stupid trackers at all.

> But these objects show on everyone else's APRS maps,
> and if you don't DR them, then they become stagnant erroneous plots.

Maps??? As in they are running a computer? They would be a lot better
off, the radio channel would be a lot better off, if they just ran a freeware
tracking program on their computer.

> > That's fine. What does this have to do with "Mach numbers" and once again
> > kludging a spec that has yet to be released?
>
> We need a means in APRS to specify velocities greater than 999 knots.

I've yet to see a compelling reason why this is needed. Let me remind you
version 1.0 of the spec has yet to be released. Maybe for APRS version
2.0? I've just not seen that many hams in hypersonic vehicles (well, at least
recently).

> In
> this case, 17,500 MPH to apply to amateur satellites for example.
> Allowing speed values in excess of 975 be translated into Mach numbers

You're really only interested in one speed then? Why not just have a switch
that triggers on the object type then? I think there is a ICON for a satellite
if I'm not mistaken.

I understand what you are trying to do, I just question the need to do it. What
you are suggesting is to both modify the protocol and to transmit speeds over

the air. Since the stupid trackers can't do DR, that only leaves the computer operators. And they would be better served running a tracking program.

Just my thoughts.

Carry on.

-Jeff

To a certain degree (and I would need to hit the books to verify this), if a object is in a stable circular orbit, you can calculate the speed if you know the altitude.

Most certainly you will know the speed within the granularity of the Mach scale you suggest.

> Most MOBILE, PORTABLE adn HANDHELD units dont have PC's with them. It is

Yes, we don't disagree the stupid trackers (Kenwood) would benefit from the positions being sent of these objects.

> Such objects are moving stations, and as such need a
> realistic CSE/SPD vector.

Why? In your last message you said the Kenwood couldn't do dead reckoning, so I still don't understand why you want to modify APRS version 1.0 to support something that is of little or no value to these stupid trackers.

I think what might be of more value is to occasionally send out the keps, be it on APRSERVE or every so often on the local lan.

-Jeff

Hi Tj,

Assuming that you are hearing this packet direct (which is probable, since it looks like the two of you are less than 6km distant from each other), then the originating station desires to have KF4HJW-10 as the only station through which its packet is passed on it's way to the greater APRS network. Your system should ignore the packet.

It appears as though KE4KLD has already assessed the local network and determined that this is the way they want to use it.

If, though, they had launched the packet as: KE4KLD>APRSM,WIDE,WIDE3-3 . . then your system ought to call-substitute for the WIDE and digipeat it.

Good question, by the way.

APRStk can do this. It can format the keps into the NASA one-line element
format and it can receive them too. Thus only one station in the world
will need to update his elements. Everyone else will be updated
automatically. I will probably send one such packet every hour or less.

Igates will need to pass this from APRServe back to RF.

OK. Not to sound like a broken record then, why would
any station have to "dead reckon" the position of the satellite then
(requiring a modification of the protocol APRS V1.0)? IMHO, it just
seems like all the tools are at your fingertips already to do a far better
job then just DR using course/speed.

(Note, any "Satellite orbital predication" program using the keps is in essence doing dead reckoning, the dead reckoning being discussed here is base solely on course and speed)

I understand the dumb trackers would need a posit sent out, but they can't do DR, hence the suggested modification to the protocol would not benefit them at all.

BTW, both basic and C source code for orbital prediction is available on the AMSAT web site. This covers all the authors except SA4, if they want to add this to their program. Otherwise, there are any number of freeware sat tracking programs available that end users can run.

Bob, I'm not in any way saying what you want to do is bad..... its great. But your suggesting a modification to the protocol for a purpose it doesn't appear well suited for. Further, and most importantly, there already exists, -today-, better methods to get the same results you are looking for, without any need to modify the existing protocol.

As not a single person from the APRS-WG (other then you) has commented here, maybe I could ask them to do so? I assume this already went through their process..... and apparently was approved? Maybe if one of them could clarify the need for the change, I might be able to understand why it is not redundant.

BTW, what did you think of my idea to use the satellite ICON to represent orbital speed? That wouldn't require a modification to the protocol if you still wanted to do D/R.

Thanks

Jeff

It was the discussion of the satellite issue that led to my leaving the APRSWG. People were complaining to me that these reports generated long vectors that were cluttering javAPRS maps. I suggested that he return to sending 0/0 as course/speed, rather than transmit erroneous data.

I have no idea if this new proposal was discussed by the APRSWG, as I am no longer on their mail list. Bob's recent post here is the first I have heard of using mach numbers. However, knowing how the APRSWG works, I very much doubt it has been approved, or even discussed. Perhaps Bob came here to discuss it because no one on the APRSWG list is willing to spar with him anymore ;-)

I am sick of this subject, but I will post my position for the record. I am opposed to Bob sending a speed of 999 MPH with the sat positions, as this is incorrect...no data is better than bad data. Even if he solves the speed inaccuracy issue with this latest proposal (and this indeed is something that must be done on the APRSWG list, not here) there is still the fact that the course of a satellite is constantly changing in relationship to the earth's coordinate system. Even the best dead-reckoning software will err because of this. Due to the speed of a satellite, even the relatively short delays of an AX-25 network can result in errors of hundreds of miles. Given all these problems, I agree totally with Jeff that there are far better software tools for this if you have a computer available.

Bob wants to use these position reports to make people aware of the passes of the sats, so that handheld and mobile users can use the the

sats without needing a tracking program. My position is that it would be far easier for these people to make use of a message giving the times and azimuth of AOS, max el, and LOS, and the max el, transmitted shortly before a pass begins. It is these numbers, not the position of a satellite, that you actually need to track a sat with an Arrow antenna, or use a D700 to transmit. This is what APRStk ought to transmit, not bogus position reports...

Feel free to ignore these musings because, as Bob is certain to point out, I am violently "anti-Bob", and fervently believe his last good idea was the concept of APRS ;-)

Steve K4HG

Jeff, Please read this paragraph. I have said this three times. I hope you can understand it this time:

Here is why. To send SAT objects for the Kenwoods to see, those objects will ALSO appear on EVERYONE ELSE'S MAP. If it doesn't have a SPEED included in the packet, then that position is a LIE one second after it is transmitted. It is a moving object. A MOVING object is MOVING and will NOT be where it was posted at any time in the future. So to provide the current location of an object that is MOVING, it must also have a COURSE AND A SPEED.

And as Steve pointed out, if the SPEED does not match reality, then deadreckoning does not work and will not then clear these objects off everyone's maps.

I don't see you on APRS. What version of APRS do you use routinely? Is it not DRing these objects?

> But your suggesting a modification to the protocol for a purpose it doesn't

- 1) Forget the purpose. There are APRS stations moving at MACH25. Are we going to accommodate any speed above 999 or not?
- 2) Tell us your better way to get this data to a Handheld THD7 and mobile D700.

> BTW, what did you think of my idea to use the satellite ICON to represent

Bad idea.

A kludge, allowing only one speed value, and also then requiring a modification to the spec. Also we have a Satellite on the top of a water tower here for local testing, It is NOT moving. With your idea, then I could not use the PACSAT ICON. Lots of problems with it.

Bob

The problem is, I do understand. Hence my concern.

All I can suggest to you, is to codify your idea and submit it to the APRS-WG. It might very well be a good addition to APRS Version 2.0. I will differ to them for this decision.

> > BTW, what did you think of my idea to use the satellite ICON to represent

Kludge? That's a interesting statement.... First of all, all you are interested in is ONE speed value, that is, the speed of a object that is in a stable orbit around the earth.

Second of all, its not a modification to the spec, its a switch in the display program. This would in no-way change any of the over the air data. The sats velocity would be shown as "0" but then the user could set there display program to detect that the ICON was a SAT, implying the object was at orbital speed, and allowing the position to be determined from using the KEPS you had sent out earlier.

> Also we have a Satelllite on the top of a water
> tower here for local testing, It is NOT moving. With your idea, then I

>From the Dictionary: Satelllite 1. A relatively small body orbiting a planet.

If you chose to use a improper ICON, sure, you'll have a problem. There are lots of problems with people using hurricane objects for the position of their house..... that's why I guess most don't do it.

The problem with a spec is people expect you to actually follow it. If you want to change the spec, its my understanding you're supposed to submit it to the APRS-WG, and they will consider it for APRS version 2.0. As you also sit on the APRS-WG, it would be my expectation that you would be secluded from any internal discussions of the APRS-WG regarding the suggested addition you made.

Good luck

Jeff

I like Steve's idea as it more directly addresses the specific requirements of the user.

Forget the purpose of APRS? Hold on a minute here, I seem to recall everytime I pointed out some flaws in APRS, I was politely told that the concerns I had (primarily reliability) were outside the scope of the purpose of APRS.

> Are we going to accomodate any speed above 999 or not?

There is no compelling reason at this time to. There are no commonly available vehicles (save military) that can actively change speed/course vectors as a normal part of their operation in excess of 999 mph. The only civilian vehicle that could do this (The Bede BD-10), never made it through FAA certification.

As I have already stated, very excellent satellite tracking programs exist that can do a far better job then what you are suggesting, without requiring modifications to the protocol or redundant data to be sent over the air. Further, now that I understand what you are trying to do, I believe the needs of the "dumb tracker" users can better be addressed by Steve Dimse's suggestion.

-Jeff

The solution to the long vectors is a local display problem. APRSdos
solved it with a Log length vector. And, No, you insisted I either send
no speed, OR the "correct" speed. And no (0) speed is not an option for a
moving object.

> I have no idea if this new proposal was discussed by the APRSWG, as I am

Its not a matter of sparing. Its a matter of discussing technical issues encountered in APRS. I posted it here because I thought that this spec list was for proposing possible modifications to the spec. That's what I thought this list was for.

> I am sick of this subject, but I will post my position for the record. I

I dont think the APRSwg is supposed to deliberate without some input from the users and others interested in contributing to modifications to the Spec.

> there is still
> the fact that the course of a satellite is constantly changing in
> relationship to the earth's coordinate system. Even the best
> dead-reckoning software will err because of this.

No. APRSst is determining the CSE vector by its changing position relative to the GROUND, NOT by its true orbital vector. Thus it is quite valid over the few minutes of the USA and mid latitudes which comprise most of the population density.

> Due to the speed of a satellite, even the relatively short delays of an
> AX-25 network can result in errors of hundreds of miles.

First, the error is only a few miles NOT hundreds. And Second, that is why moving objects are transmitted with TIME,COURSE and SPEED. It doesnt matter when it gets to you, since APRS Dead Reckoning will then be able to place it correctly.

> bogus position reports...

Wrong. AZ/EL angles only apply for one observer at one place on earth. The AZ/EL to the satellite is different for all observers. The only accurate info that is universal is the satellites POSITION, TIME and CSE/SPD vector. From this, all else can be determined by ALL observers no matter where they are.

> Feel free to ignore these musings because, as Bob is certain to point

> Steve K4HG

The problem remains. APRS does not address speeds in excess of 999 Kts, yet we have 4 satellties using APRS, and we have a commitment for the International Space Station to use APRS and MIR/Shuttle will use APRS on occasion. THus APRS should address how it is going to handle these moving stations at orbital speeds.

I am open to any other suggestions as to how to incorporate these speeds into APRS that are backwards compatible to the existing users. One other thought was to let 999 = 17,500 MPH and let 998 = The speed of the Concord. These are two notable exceptions. But rather than doing it that way, I proposed the MACH number approach above 975 Kts to allow for greater flexibilty... If there are other ideas, other than ignoring the problem, I am certainly open to discussing them..

You told me these are for transmission in local areas, not for worldwide
consumption. Have you changed your mind on this?

>accurate info that is universal is the satellites POSITION, TIME and
>CSE/SPD vector. From this, all else can be determined by ALL observers no
>matter where they are.

>

Well, Bob, you clearly are much better at trig-in-the-head than I.

If you tell me I'm at 24 42.54N 81 24.63W, and the sat is at 28 12.83N 83
22.63W, I sure can't figure out the elevation in my head. In fact,
neither can a computer, since you also need to figure in the altitudes. I
can guess it would be roughly NW, and the bandwidth of an Arrow is large
enough I should be able to find the sat, but I still have no idea how

"good" a pass this will be(i.e. what will be the max elevation).

On the other hand, if I know a pass starts at 4:30PM at 263 degrees, reaches max elevation of 53 degrees elevation, 24 azimuth at 4:36 and ends at 4:45 at 58 degrees, I have a great idea of where the sat will travel. Far more useful to my "non-engineering mind" as you call it!

How about the users? Which would you rather see? Or are all of you tired of this little glimpse at what the APRSWG was like? Promise, no more from me on this subject, I've moved on...

Steve K4HG

A "local display problem" that would require changing the source code in EVERY SINGLE APRS display program out there with the changes you propose. Its great you have gone ahead and already done this, yet we now have a APRS-WG in place, and like it or not, the APRS-WG is supposed to keep some consistence in the user code space.

And speaking of "local display problems", what again was your concern with using the satellite ICON to signify an object was a small body orbiting the earth? *IF* a author wanted to change his code to incorporate this, he/she could, but if they didn't, it would not adversely effect the user experience and/or generate bogus data.

> I dont think the APRSwg is supposed to deliberate without some input from

Two users have already made comments on here regarding your idea.

What about all the other APRS display apps out there? Also, any part of the spec should work (IMHO) over the whole world, and not just the USA.

Do you have the spec available for "APRS Dead Reckoning" as I don't seem to see it in the protocol document. I question if it can do a good job in tracking an object in orbit and would like details.

So your typical handheld HT user is using a antenna with a beam width of 0.1 degrees or less?? WRONG. Typical beam widths are going to be on the order of +-30 degrees for a antenna you can hold in your hand. As such, small errors, such as from a APRStk station 50 miles away, won't amount to much for the typical altitude of most PACSATS.

> The problem remains. APRS does not address speeds in excess of 999 Kts,

It's called APRS Version 2.0. Propose your idea to the APRS-WG. BTW, there is no reason you can't create your own, independent protocol to do this, but I'd not try to mix it in the standard APRS Version 1.0 data stream IF it's going to give bogus reports, which apparently was going on. IMHO, this is grounds for "APRS compatible" de-certification, if/when these labels are assigned by the APRS-WG.

> I am open to any other suggestions as to how to incorporate these speeds
> into APRS that are backwards compatible to the existing users.

Satellite ICON = small body in orbit = ~17,500MPH = local display issue =
problem solved without a kludge to APRS V1.0 over the air protocol.

This wouldn't adversely affect legacy users as your suggestion might. Still
not a good solution for orbital prediction, but at least it wouldn't require
needless modification of the protocol.

I'm agnostic on whether to represent speeds > 999 kts in APRS.
But I'm compelled by my background (and doubtless my nit-picking
nature) to mention that to say something is moving at a Mach number
of 11 (for example) says nothing about what its speed is. Mach
number is a **dimensionless ratio** of the characteristic velocity
of a flow (for example the speed of an aircraft) **to the speed of
sound in the undisturbed regions of the flow**. So 1000 kts could
be any Mach number you like. If you specify that your fluid is
air, then the Mach number still varies with changes in conditions,
in particular with temperature.

Of course, you **could** say that the speed is Mach (x-974) in a
standard atmosphere (homogenous air at STP). But why bother?
Why not just say its (x-974)*1000 kts (for example).

For what its worth, I can see the usefulness of having the satellite information available to the Kenwood users. And the need to have a visual reference of the sat position at a given time. So why not instead of trying to make an object travel across the screen at ANY speed; instead put the object up at the apex (if that is the right word, I mean the highest point) relative to the issuing station with a time stamp that indicates the time of maximum coverage area.

It is obvious that this is a local use option. I certainly am not going to be interested in information about satellites from a station hundreds of miles away thus it couldn't possibly have any internet use. So how about it. You get the object and information out there prior to the satellites apex with a time of maximum coverage and usefulness; add in any additional information that you need such as time overhead or horizon to horizon or whatever. But forget the moving object issue because it may or may not be accurate and besides who would use it? The information is more important than the object moving. Then at the end of its usefulness send the delete code.

Well that is my point of view, for what its worth. I'd hope that Bob and Steve would be able put away this apparent personal issue between them and lets get back to improving this wonderful aspect of our HOBBY!!!

73

Scott, KC5JGV

I didn't say that. You were objecting to my purpose for needing to
address orbital speeds in APRS. I was saying the purpose doesnt matter.
We have the problem of APRS stations at orbital speeds that need to be
addressed for whatever purpose.

> > Are we going to accomodate any speed above 999 or not?

We are not talking about "changing" vectors, we are talking about
representing velocities. I already listed 4 existing APRS orbiting

objects and 3 very well known manned vehicles that fly at those speeds.

> As I have already stated, very
> excellent satellite tracking programs exist that can do a far better job than
> what you are suggesting

Then you dont understand. I am using an excellent tracking program to generate the satellite positions. It is able to provide tracking accuracies to 0.5 degrees for LEO objects moving at rates as high as several degrees per second. I am suggesting NO OTHER method for tracking satellties.

> without requiring modifications to the protocol
> or redundant data to be sent over the air. Further, now that I understand what

But his suggestion is flawed as I previously noted. Lists of pointing angles are valid for only one position on earth. They are useless for everyone else.

Yes, I considered the .50/.50 as actually the best indicator too, but
figured it would be even harder to find agreement to it... :-)

Yes, The D7 and D700 still compute from the 00 position.

This is more or less what Steve Dimse suggested. Or at least it could be derived from his suggested method.

I think that people who want to communicate via the satellites
should have more sophisticated software then dead-reckon.

If I have to pay money for it, then I want to run it with the Keps
and have a quality track.

I need to know the Doppler based on my location, and at
400 MHz/9600 baud it may be more critical than dead-reckoning
would predict.

Whatever the case, I don't want this huge vector blasting onto

my screen. If it is moving across my position at 9000 m/s, all I want is a small vector that possibly is a Doppler based on my position, and is shown ahead of, or in trail of the satellite as it passes. Maybe blue and red colours, etc.

Make it so...

You still dont understand the issues. I am posting the objects *for* those HT/Mobile users without tracking software. But as a consequence, the objects will also appear on everyone *elses* maps, and these will be *DeadReckoned* as a consequence (Thats what APRS does). So therefore they need to have a CSE and SPEED that is accurate so that they will be DR'ed properly... and not erroneously. In fact it was you who pointed out the erroneous DR that I am trying now to fix.

> >The AZ/EL to the satellite is different for all observers....

Steve:

> You told me these are for transmission in local areas, not for worldwide
> consumption. Have you changed your mind on this?

Nope. In Maryland, I expect my satellie objects will be seen out about 150 miles in all directions. THus for the Shuttle in a 150 mile orbit, the difference in AZ/EL angles for a station south of me and one north of me can EASILY see different AZ angles by 180 degrees! and Elevation angle differences of 45 degrees or more. That's why posting AZ/EL angles is pointless.

Bob continued...

> >... the only accurate info that is universal is the satellite's
> >POSITION, TIME and CSE/SPD vector. From this, all else can be
> >determined by ALL observers no matter where they are.

> Well, Bob, you clearly are much better at trig-in-the-head than I.

Thanks. But it isn't rocket science. Just visualize two users, one north of me and one south of me during a north south pass and I think anyone can see the gross errors that AZ/EL predictions would cause.

> If you tell me I'm at 24 42.54N 81 24.63W, and the sat is at 28 12.83N
> 83 22.63W, I sure can't figure out the elevation in my head. In fact,
> neither can a computer, since you also need to figure in the altitudes. I
> can guess it would be roughly NW...

Then you haven't seen the APRStk object on your D7 or D700. The Radio
computes for you an exact azimuth based on the *position* of you and the
satellite. The OBJECT also tells you the satellite's Frequency,
AND the Distnace AND the RANGE... Everything you need. Just comparing
the Distance to the 500 mile height can give you a very good idea of
elevation angle. Example. If its 500 miles distant, then the angle is 45
degrees.

> On the other hand, if I know a pass starts at 4:30PM at 263 degrees,
> reaches max elevation of 53 degrees elevation, 24 azimuth at 4:36 and
> ends at 4:45 at 58 degrees, I have a great idea of where the sat will
> travel....

Yep, but that is a personal prediction for your own given location.
And how many of these personal AZ/EL predictions do you want me to
clutter the airwaves with? To be as accurate as you demanded in your
initial post, then I would have to send out say 16 such alerts, one for
each 50 miles and each of the cardinal directions from my station. Then
the poor users would have to figure out which of these 16 messages applied
to him... A hopeless mess... I think the single OBJECT I am posting is
much more effecient use of the channel.

> How about the users? Which would you rather see? Or are all of you tired
> of this little glimpse at what the APRSWG was like? Promise, no more from
> me on this subject, I've moved on...
>
> Steve K4HG

Yep, Here is what the users would choose from:

My way: A single U014 posit on their front panel showing the actual
azimuth in real time and all the other info about FREQ,
direction of movement and so forth no matter where they were.

Your way: Their message list (can only hold 16 messages) is full of
lists of times, angles and Dopplers which they must then
compare to their location (to konw which one to use) and
then they have to compare the times with their watches
to know what angle to use when, and when to tune...

Also, my ONE packet applies to the whole USA (if we can ever get the
IGates to carry it), wheras your plan would take about 200 individual

messages that could have errors of over 45 degrees.

The choice seems obvious to me...

Bob

Hello, group -

There has been a fair amount of discussion related to things like "DX Spot" which have referred to "APRS as implemented by Kenwood" or variations, there-of.

Can someone tell me where to find the as-built description of the protocol in the Kenwood machines?

Many thanks,

Jim Wagner

No, they dont need to change it if their users will put up with speed vectors 10 times longer than their screens... APRS has always had a speed range of 1 to 999 MPH. If their software did not accomodate this, then its a local display problem.

It does work everywhere. Satelllite ground tracks are essentially straight lines on the surface of the spherical earth.

> Do you have the spec available for "APRS Dead Reckoning" as I don't seem
> to see it in the protocol document. I question if it can do a good job in
> tracking an object in orbit and would like details.

Simple physics. An object in motion tends to stay in motion along the same path unless operated on by an external force. In this case, the path is the ground track which is essentially a straight line.

I dont know where you inferred 0.1 degree. About 60 degrees is probably the 3 dB beamwidth.

> Typical beam widths are going to be on the order of +-30 degrees for a
> antenna you can hold in your hand. As such, small errors, such as from a
> APRStk station 50 miles away, won't amount to much for the typical

> altitude of most PACSATS.

You might say the error is small, but it is that kind of sloppiness that should not creep into APRS. Say my program predicts a pass of the Shuttle to peak at 60 degrees to the east. A user 150 miles east of me sees that prediction goes out to the EAST side of his building to show off to his colleagues. Boy will he look stupid when the satellite passes behind his building to the west at 60 degrees and he cannot hear it because it is blocked by the building!

Can someone suggest what a "Kenwood" symbol ought to look like?

They will/do. The object will be updated by a true prediction program every minute. No one has said that DRing is how we plan on plotting the satellites in APRS. People have gotten everythign totally confused. DRing is NOT the intent at all. It is simply a consequence that must be addressed for moving stations for those objects properly and accurately placed on a map by ANY program.

I had meant to make some more comments on APRS Version 1.0 too, but its public discussion period ended on December 19, 1999. <http://www.tapr.org/tapr/html/Faprswg.html> ;-)

But seriously now, I don't see any good reason for this to have become such a big fuss. Seems no terrestrial objects are going to use the last few numbers possible (greater than 900 knots) in the speed field. Why not allow Bob to use those numbers to display satellite speeds in his applications? If they cause long DR line displays that bother other than Kenwood D7/D700 users, have the bothered users simply turn off DR in their APRS applications. I've been coping with long DR lines from mobiles using \$GPRMC for years already as things are.

Ian,

While attempting to write code to decode compressed position reports an error in the examples was found.

Chapter 9, Compressed Positon Report Data Format, page 32,
Lat,Long decoding :

To decode a compressed lat/long, the reverse process is needed. That is, if YYYY is represented as y1,y2,y3,y4 and XXXX as x1,x2,x3,x4, then:

$$\text{Lat} = 90 - ((y1-33)*91^3 + (y2-33)*91^2 + (y3-33)*91 + y4-33) / 380972$$

$$\text{Long} = -180 + ((x1-33)*91^3 + (x2-33)*91^2 + (x3-33)*91 + x4-33) / 190486$$

For example, if the compressed value of the longitude is <+%A (as computed above), the calculation becomes:

$$\begin{aligned}\text{Long} &= -180 + (27*91^3 + 10*91^2 + 4*91 + 32) / 190486 \\ &= -180 + (20346417 + 82810 + 364 + 32) / 190486 \\ &= -180 + 107.25 \\ &= -72.75 \text{ degrees}\end{aligned}$$

$$\text{Look at the statement } \text{Long} = -180 + (20346417 + 82810 + 364 + 32) / 190486$$

The Value 82810 is supposed to be 91^2 or 8281, not 82810.

The next problem I encountered had to do with the precedence of math operations. I copied the example almost verbatim. Must be getting lazy in my old age. The results of decoding the compressed location data were not within reasonable limits. I modified the example code to ensure that math operations were carried out in the proper order. That is, when in doubt as to the precedence of operations, add parentheses! Here is what I came up with :

$$\begin{aligned}\text{Lat} &:= 90 - (((\text{CLat}[1]-33) * 753571) + ((\text{CLat}[2]-33) * 8281) \\ &\quad + ((\text{CLat}[3]-33) * 91) + (\text{CLat}[4]-33)) / 380972; \\ \text{Lon} &:= -180 + (((\text{Clon}[1]-33) * 753571) + ((\text{Clon}[2]-33) * 8281) \\ &\quad + ((\text{Clon}[3]-33 * 91)) + (\text{Clon}[4]-33)) / 190486;\end{aligned}$$

The results now appear to be reasonable.

Several other examples in the documentation do not clearly illustrate the required precedence of math operations. These may work in some versions of

Basic, but the purpose of examples should be to provide the reader with example code or algorithms written to clearly illustrate the math processes required.

Overall, the documentation is a superb piece of work. Hopefully, minor errors, and modified examples could be provided in any future release.

My original comment was, that if there is any math past a sum or product, it
should probably be written using standard math notation, and forget about the
B.A.S.I.C., Fortran, C, or Forth examples.

The spec is being written using Microsoft Word, so I know that math symbols
are available. Actually, I would rather it be left in Microsoft Word than
converted to PDF, which is completely useless if you want to make notes to
yourself. You would have to print it out and OCR it back in, and then correct
all the errors. Really a mess. Just leave it in Word.

>

>The Value 82810 is supposed to be 91^2 or 8281, not 82810.

No, it is *ten times* 91^2 (see the third line of your quote above).

>

>The next problem I encountered had to do with the precedence of math
>operations.

I know. There are several misleading math statements throughout the spec, arising mainly from just taking the statements from original documentation. There was a very tight deadline to get the draft finished in December, and there wasn't time to straighten it all out. I'm now fixing all these statements to make them consistent and mathematically rigorous.

Jonathon,

I believe the "port failed to open" error can be experienced when attempting to open a port that is being used by another application. Com ports can not be shared between applications. Perhaps you had another application using the comport when you experienced the error? Is the Kenwood control program still running?

Bill KC9XG

Hi All,

A not so friendly reminder that it is now 60 Days to the start of the Atlantic Hurricane Season, with no useable hurricane protocol defined. I believe the Working Group has dropped the ball.

They said they weren't developing anything new, just documenting
what was already there. How is not developing *any* protocol
"dropping the ball?"

They didn't develop a forest fire protocol either...

What's wrong with just putting a hurricane symbol on the map?

I agree. They claimed to be documenting APRS. Not enhancing.
That is something to be left to the next version.

Charles

Steve and all-

The hurricane spec in the Draft of the protocol bears very little relationship to what was used up until now- It is new and not used by anyone. I jumped up and down about this 4 months ago and was assured it

would be taken care of. The problem with "just putting a hurricane symbol on the map" is that the current position of the hurricane may be the least important piece of information needed. What areas the wind fields affect, and what the predicted wind fields might be, are far more important for emergency planning, both personal and governmental.

Steve Sampson Said:

I thought the hurricane stuff was working fine. It has these features:

- 1) Both Hurricane, Tropical Storm and Tropical Depression ICONS defined
- 2) Icon for future predict posits defined
- 3) Include CSE and SPD of movement of the storms
- 4) Reports peak and sustained winds
- 5) Reports Barrometric pressure
- 6) Reports radius circles for TROP and HR force winds in two colors
- 7) Offsets the wind circle into the danger quadrant
proportional to vector sum of wind speeds and storm track

What is missing?

Bob

Bob and all-

So which spec should I use- the one contained in wx.txt in the readme folder of Dos Aprs - or the Draft Protocol?

They are not the same- nor are they compatable

If it is the Draft Protocol, is everyone going to get a new version out in time for Hurricane season?

If it is the old spec, why hasn't the Draft Protocol been changed to comform?

The Draft Protocol has the central pressure moved to the end of the string and a digit added which means that the wind fields will not parse properly in any known version of dos/mac/win/palm/x/aprs.

I pointed this out in January.

We are waiting for comments from the SProuls. My software doesnt care. I
dont know how the fields got moved around, but My opinion is that we go
with what was in the dos TXT files unless someone can come up with why it
was changed...

I think your missing Dale's point (and one I feel strongly on also). Your extensions need to be incorporated into the APRSPEC. I would think that one of the reasons for the SPEC is to reduce so many different implementations of each authors favorite "protocol". Thats not to say what you or anyone else is doing is "wrong", its just a process now exists to addresse these changes/extensions.

Thats what I mean. Unless someone can say why the SPEC got it diffeent
from my WX.TXT file, then lets fix the spec to what it should be...

G'Day All...

It has just been suggested to me that the TO callsign for dGPS transmissions should not be dGPS but dGPSxxxx (or how ever many characters is allowed by the TNC) with the xxxx being the station ID of the dGPS station. Also in Ham Radio maybe we should be coordinating dGPS station ID's and recording them somewhere centrally (like on the iGATE database)...

I know this is only a partial SPEC issue... But I thought I would raise it here....

Would there be some benefit to the xxxx being the Maidenhead square rather than a lookup table value?

Can you explain further? The full callsign of the DGPS station is in the
FROM field. So I guess I dont see why it needs to be in the TO field too?
But if there is a need, let us know...

Now there is something that would help (on a channel that had lots of DGPS stations) - having dGPSxxxx with the xxxx being maidenhead square... then gateways would only relay the nearest dGPS station... and/or your system would only select the dGPS station that had the best info (nearest to you....)

The AX.25 specification states that call signs are six upper case or
numeric characters, blank filled.

Would need to be dGxxxx (or possibly dGPxxx-x).

But the station ID is already in the DGPS data stream, other then human
readability,
what value would the station id be in the callsign field?

> Also in Ham
> Radio maybe we should be coordinating dGPS station ID's and recording them
> somewhere centrally (like on the iGATE database)...

On the TAPR DGPS, most are using "73" and I don't believe they have a official
coordination from any body that is already doing this. I'm not sure of the
ramifications of
having the same station ID, other then likely its "not good". Also, you need to
remember
that the TAPR DGPS is not the only source of DGPS data available to hams. Some are
now
experimenting with DGPS over IP, which typically uses the coast guard stations for
its
data source (but can use anything).

> I know this is only a partial SPEC issue... But I thought I would raise it
> here....

Being the station ID is in the DGPS stream already (which is clearly defined) and there is no mechanism (that I know of) to coordinate station ID's for amateur DGPS stations, it might be best for the spec to avoid this issue entirely.

Just my thoughts.

G'Day

To explain further, the way that dGPS works is that there is a 'STATION ID' encoded in the dGPS data. This is a number from 0 to 1023. If the data from two dGPS stations using the same 'STATION ID' at different locations is sent to a single GPS the results could lead to bizzare and very incorrect results.

Whay I am suggesting is that

a) we encode the 'STATION ID' as part of the T0 callsign e.g. dG0073 for StationID 0073. dG1023 for Station 1023 etc. This would allow users to easally filter the data based on callsign rather than the content of the data which would be nasty if you were wanting to do it in PC software (one more area of bugs) or a PIC for teh GARMIN RTCM Rx Packet problem...

b) But we would need to make sure that all users used a different STATION ID... Simple way would be to suggest a number based on a HASH of the callsign... Or at least encourage random numbers.

I believe there is some software in 'C' being releast at some stage for MOT to RTCM conversions so we may as well get this issue sorted now.... Also I have during testing been feeding dGPS to the iGATE....

Can you explain further? The full callsign of the DGPS station is in the FROM field. So I guess I dont see why it needs to be in the T0 field too?

But if there is a need, let us know...

I probably don't understand something fundamental, but...

Why don't you simply differentiate DGPS stations based of the "from"
call sign? Uniqueness is then assured, (plus or minus misconfiguration).

Alternatively, you could concatenate the "from" call and the "station id"

prior to testing for equality.

The way the DGPS is generally used is the raw data from a TNC is passed to the input of a GPS without further processing. It can indeed cause problems if multiple stations use the same station ID. The answer is local coordination of ID's. Adding another ID code in the to call does nothing to solve the problem.

Yeap, but the Reference station I.D. is in the first word of each DGPS message.
Its the 15th through 24th bit (30 bits total including parity). It should be the
first thing after the "DGPS". 30 bits is not to much to deal with even for a
PIC.

In any case, you really should only have "one" (the best) DGPS station in each
area, or
make sure the data is valid for each area. You don't want to be sending Point
Blunt
data in Germany, for example when more local data is available. But that is more
a common sense issue then anything else.

> b) But we would need to make sure that all users used a different
STATION
> ID... Simple way would be to suggest a number based on a HASH of the

Yes different ID's. But I believe there is already a body that assigns ID's. I
think with
DGPS-IP using commercial services, you'd be well advised not to have people
picking them randomly.

While part b) is a worthy point to discuss, I think it is outside the scope of
the APRSSPEC.

And who would do this? I thought these ID's were assigned by the Coast Guard.

This is why I earlier stated that I thought the APRS-WG shouldn't touch this. No need to deal with it as its already been delt with.

I agree. The ID's are coordinated by the CG, but I very much doubt they
will be giving them out to hams. The idea is just to pick a number
different from that which everyone else is using. Since there is no
crossover between the APRS DGPS transmitters and the CG ones, there
should not be any problem...

No. You just set the switches on your DGPS. I used my home address, but I put it in backwards, so it's reverse binary, oops...

The Coast Guard only handles Coast Guard stuff, they don't have the manpower to handle every frequency someone puts two or more DGPS's on.

I do think the whole DGPS issue is going to go away in a few years, as the Coast Guard fills all the gaps with its 300 kHz stations. Hombrew DGPS will no longer be needed.

The operative word here is "not yet". Your well aware that it would be a trivial matter to port the DGPS-IP over to APRS. Hence, one should not go on the assumption one will never see the CG transmitters data stream on APRS frequencies.

I don't think its that big of a deal in any case.

Exactly. But my point was you don't want to go randomly assigning them
without some knowledge of what has already been assigned.

> I do think the whole DGPS issue is going to go away in a few

I believe the point of APRS DGPS is the data shares the
same radio channel and/or technology. I.E. A VHF channel. The ham doesn't need
to purchase a \$300+ DGPS receiver/antenna combo. With the TAPR DGPS all a
end user needs to do is wire the RTCM input to the TNC out.

The fact that we will have good coverage of Coast Guard stations won't change the
obvious economic advantage of this solution.

The longwave "USCG DGPS" systems coverage actually is worldwide. See:

<http://www.csi-dgps.com/dgps/maps/world.htm>

Kinda makes you wonder why they even bother with S/A...

Very slightly off-topic:

If all you want is to DGPS-correct the local GPS and not to rebroadcast
the DGPS stuff over amateur frequencies, you can do that now with "gpsd"
and "Xastir" on Linux and perhaps other Unix-based OS'es.

Ahh, but that would probably be against FCC rules.

97.113

(e) No station shall retransmit programs or signals emanating from any type of radio station other than an amateur station, except propagation and weather forecast information intended for use by the general public and originated from United States Government stations and communications, including incidental music, originating on United States Government frequencies between a space shuttle and its associated Earth stations. Prior approval for shuttle retransmissions must be obtained from the National Aeronautics and Space Administration. Such retransmissions must be for the exclusive use of amateur operators. Propagation, weather forecasts, and shuttle retransmissions may not be conducted on a regular basis, but only occasionally, as an incident of normal amateur radio

communications.

I suppose you could argue this, saying that part of the error that dGPS corrects is propagation error, but I personally would have a hard time saying that with a straight face...

It is interesting that it would be quite legal to retransmit a dGPS broadcast from the internet, as long as it was sent directly to the internet and not through a radio first. On the other hand, it would seem to be illegal for me to use MacAPRS to send a message through an IGate on my new laptop, which uses an 11 Mbs Airport link. The signals are on 2.4 GHz, so technically IGating a message is the retransmission of a 2.4 GHz Part 15 transmission.

Amazing how rules that were once concise and unambiguous get left in the dust of technologic progress!

Maybe, but not really relevant with regards to this discussion. Also, note the discussion started with (I think) a Australian ham, who of course is not bound by FCC rules.

I let people make their own decision with regards to the rules.

Last time I looked, Ionospheric delay (which DGPS corrects) is propagation error. Also corrects atmospheric delay (I think they call that slant angle? Gerry?).

> It is interesting that it would be quite legal to retransmit a dGPS

Impossible to determine this.... I mean, if it goes through one microwave or SAT telco link its "radio". I take this rule as having the radio receiver and transmitter at the same site directly hooked together. Hence, a non issue. Also, if you reformat the data (which you are), are you really rebroadcasting it? To fuzzy, FCC won't waste there time prosecuting you unless your really crossing the line. Get your own legal opinion, but I'd not worry much about it.

Yeap, the moral of the story is have a good attorney on retainer and always act in good faith. I don't spend alot of time overanalyzing the rules, but look at the intent. Things simply are moving to fast.

It's surprising how much you can do without a national organization!
(OK, OK, I'm just kidding...)

Part-15 SS, the only way to go! Part-97 rules are completely bogus

above 30 MHz. Only a relay league could cherish the product...

I run a 5 mile 2.4 GHz link between myself and a friend. I'm thinking of using it to run a split repeater site on 2 m. Putting together another 5 mile link to the ISP. I've got these down to about \$650 a node, or \$1k per back-to-back link (\$450 per 500 mW bridge, \$100 for Radio Shack tri-pod and mast). "Only" 1.6 Mbps though.

I can see the time rapidly approaching where mobile emitters at 2.4 GHz would be possible in many cities with a central node. All of the imposed APRS hacks to work at 1.2 kbps would seem quaint :-)

To clarify, I thought your use of "US concentric" meant it was only a U.S. territorial

DGPS system. Its been adopted over a large part of the world. As to coverage, well that's

up to each individual area to do on their own.

Well, us people in the newer ex-british colonies are sort of disadvantaged when it comes to dGPS infrastructure... Whereas the USA has probably 100 stations, Australia has less than 10 operational stations, for a country about the same size, with more coast line.... I personally would call it northern-hemisphere-centric myself... It looks like 90% of stations are in the north, and most are in the west.... So us poor people in the south-eastern quadrant are left out :-)

My point continues to be lost...

It is not up to the U.S. to finance DGPS stations throughout the world.... fact of the matter is,
most of the world is freeloading off the present U.S. owned GPS satellites.

My point was that the "U.S. Coast Guard longwave MSK type DGPS system" works many places in the world with the same receiver. I can take my CSI SBX-2 DGPS receiver board,
and have it work on the Detroit MI USA DGPS station OR one of the stations in Australia with
no intervention on my part.

Hence, I don't consider the DGPS system in question to be "US concentric" at all. Even if it
were, I think some consideration needs to be made regarding who invested the millions
of dollars to make it work.

Now directly addressing your problem, have you considered setting up your own

MSK DGPS station(s)? In the U.S. we have a license free band from 160khz-190khz that I used to play around with alot in my younger days. Building a transmitter for that

range (well 200-350 in the case of DGPS) is not that hard. Couple that with the TAPR DGPS board and a little extra firmware and I think you'd have the makings of a DGPS station. Now with the apparent lack of DGPS coverage in Australia, I'd think

your radio authorities might be a bit liberal in assigning experimental licenses for you.

Seems like a good cause for a ham club.... might even get some funding from the government

to offset you expenses. Make them solar powered, maybe 10 watts or so transmitters, 50

foot helical loaded antennas.... should give maybe a 10 mile range or so.... or go higher in power

if you have commercial mains available and/or bigger antenna.

BTW, WAIS is presently being tested now.... not sure if Australia is in the footprint, but this

maybe the reason for the lack of longwave DGPS stations..... they won't be as needed in the future.

73

Jeff

Hello, I'm trying to understand the SSID Path routing method as implemented in the TM-D700.

There is not any digipeater in my area that implement the SSID Path method for routing the UI frame with another firmware, I never found in the APRS protocol specification how the method work exactly, and I want to be sure that my observation is correct and this is how the protocol must be implemented.

First the SSID Path routine in the D700 must be enable with the command UISSID and digipeater ON.

I've observed that when UISSID is ON the digipeater repeat all the UI frame addressed to ANY CALL with SSID > 0 (not only the mycall or other generic call) and repeat as follow:

>From SSID > 0 and SSID < 8

The frame will be repeated with the SSID of destination decremented by one and the call of the digipeater will be put in the via list.

Example:

A frame like this (MYCALL is IW3FQG and UNPROTO is APRS-6):

IW3FQG>APRS-7:

will be repeated to:

IW3FQG>APRS-6, DIGI*:

With SSID > 8 the translation rules is different because there is the direction rule.

If SSID is equal to 8 (North direction)

If the digipeater listen an UI frame addressed to ANY call with ssid = 8 it repeat the frame, put the SSID of destination to zero, put the digipeater callsign in the via list and attach to this if available the path for North direction (NPATH parameter in D700).

Example:

A frame like this (MYCALL is IW3FQG and UNPROTO is APRS-8, NPATH in the

digi is set
to NORTH):

IW3FQG>APRS-8:

will be repeated to:

IW3FQG>APRS,DIGI*,NORTH:

If SSID is equal to 12 (North direction)

If the digipeater listen an UI frame addressed to ANY call with
ssid = 12 it repeat the frame, put the SSID of destination the same as
received,
put the digipeater callsign in the via list and attach to this if
available the path for North direction (NPATH parameter in D700).

Example:

A frame like this (MYCALL is IW3FQG and UNPROTO is APRS-12, NPATH in the
digi is set
to NORTH):

IW3FQG>APRS-12:

will be repeated to:

IW3FQG>APRS-12,DIGI*,NORTH:

The same rule is valid for South (SSID 9,13) East (10, 14) and West (11,
15).

I've observed that in all cases if the frame is sent with a digipeater the
via
path (es: APRS-8 VIA DIGI) the frame is not repeated.

IW3FQG>APRS-8,DIGI:

Is not repeated by the digipeater.

Do you know if all these rules are correct?

Thanks in advance.

Marco IW3FQG

Hi all:

I think a limited set of goals are outlined for APRS version 1.0, but the world has changed substantially since APRS was conceived.

It might be worthwhile to consider the "vision" of APRS before proceeding on to version 2.0. Vision in the sense of seeing the future direction of the world, and setting some specific goals here.

It would be helpful here to have some discussion from members of the APRS-WG, who with one exception, have not participated very much in an open forum discussing the future of amateur AVL.

I've got a few things to throw out, while not goals, might get things started with

APRS version 2.0. Lots of this has already been discussed here.

1. Backwards compatibility should not be a major issue.
2. Reduce the number of protocols... I think there are 4 or 5 ways to say the same thing now. Maybe just standardize on compressed format or something.
3. What is the purpose of APRS? List a bullet sheet in decreasing order of importance.

This will be useful in making decisions as a weighting factor.

4. Have extensions for balloons/sats to accommodate there increased height/speed *accurately* while not overly impacting terrestrial operations (maybe a 16 bit field for balloons/sats where as terrestrial only requires 8 bit)
5. Adopt or suggest a broadcast protocol on different frequencies. Maybe adopt the PACSAT method for this.
6. Come up with a "official" slotted protocol for all GPS equipped trackers
7. Adopt a "APRS time protocol" be it internet based or over the air based.
8. Do we really need AX.25? At least redefine the APRS protocol so it is transport method independent.
9. Consider the big picture. How can the APRS model be made attractive to other users within amateur radio, such as DX cluster, weather, convers, etc. Any "one to many" type use.

I'm sure there is more, but first and foremost we need to get a idea of the Vision...

what are we trying to accomplish? What is most important and what is least important?

How is the world and amateur radio changing? How could APRS/AAVL be made more attractive to power users?

I'd like to see what people think, in particular the members of the APRS-WG.

Thanks

Jeff

> that is just semantics, it really doesn't matter.

2 hops through 1000 foot digi's in urban areas when a I-gate is 0 hops
away is to long of a path. Conversely, 5 hops in a rural area to get to
the closet I-gate is OK. One has to be pragmatic here, better yet the
software should do it for one. The point is every station, and I-gate
has DIFFERENT RF capabilities. There is no standard amateur
station. Hence the smart software should deal with these issues.

And yes, IT DOES MATTER. Read some of the packet radio papers/
books I cited earlier.

> >I'll try and find Tom Clark's and Bob's article on the subject if you
> >promise me you'll
> >read it. I think Tom's was in a early PSR.
> >
> Don't bother, I really don't have time. Please understand, I'm not saying
> these are bad ideas, or wrong ideas. This is just not something that
> interests me enough to spend my precious time on.

Oh, so the "radio" side of packet radio doesn't interest you? Hmmmmmm.....
Certainly your choice to ignore this stuff, but as you can see, many people hold your words in godlike esteem. Understand the power that this holds and weigh what you say with what you know to be true. I DO NOT fault you for this, but you'd be amazed at the amount of private hate mail I get supporting you whenever I question you on these types of issues. Yet you say these same issues don't interest you.... Life ain't fair, is it?

> Perhaps I wasn't specific enough in what I was asking, allow me to
> rephrase:
>
> Is anyone actually working on implementing these ideas in a working
> system for APRS users? This was the question I really am interested in.

And perhaps I wasn't specific enough. YOU (and others) are working on these sort of things.... you just don't know it. It would be trivial (in some cases) to adopt the prior art I am pointing out to you. That's why I am posting this stuff here.... in the hopes those that already "have the wheel" can adopt them. I just don't see the need to completely re-invent the wheel here for what is simply good amateur practice.... yet increasingly it is becoming apparent to me that is what is needed.

It simply would be much easier to do this within the system as opposed to completely scrapping the system we have and starting over. This is why I continually nudge you and other APRS leaders to adopt best practices of other packet radio amateur radio groups..... be they U.S. packet hams of 10 years ago or the Europeans today. We simply don't need to keep placing our hand on the stove to realize its hot.

My interest really is to improve the system and not to throw rocks at programmers or the APRS-WG, as you seemed to imply in the close of your last message. But if people are closed minded, or unwilling to discuss these issue in an open forum, I'm sure it could come off looking like that. But if you really knew me, you'd know my intent was positive.

But to more directly address your question, yes, I know of one party experimenting with APRSserve RF data broadcasting. It is up to them to disclose it to you which I'm sure they will if and when they are successful. The other items WOULD require cooperation within the APRS community to implement, and hence I know of no-one doing them. To paraphrase your comment of "build it and they will come", simply cannot be the case without some corporation within the community, in particular when we are discussing networking issues and/or smart software. These things really need to be addressed more formally, something I'm suggesting be done.

> At some point though I had to say enough, pick a set of tools, and Just

> Do It.

I believe the first sentence of my earlier posting said this was future food for thought. Its up to each person to open their mind to others ideas.

> If APRS were a commercial system generating millions of dollars a year,
> then there could be a core of hired programmers that did what they were
> told. In a world like this, it is easy to turn vision into function.

Hmmmm.....the business model of Linux keeps coming to mind. This also tells me that more often then not, we are are own worst enemy. Many "hobby" or open source things rival or exceed the commercial world. For all the supposed "warts" of APRS, it really DOES rival some things in the commercial world..... in particular YOUR stuff.

Don't sell yourself short....

-Jeff

This may be obvious to some, but it seems to me that what we're not saying
in the digi path is what we are trying to do. IOW, We're telling the
system what to do, not letting the system decide how to accomplish a goal
within the local environment.

> Certainly your choice to ignore this stuff, but as you can see, many
> people hold your words in godlike esteem.

I don't think that's possible in Ham radio :-). The "rasberry" seems to predominate most communication.

I think one of the responsibilities of a digi owner is to moderate the data onto a fixed/limited bandwidth. It really is an individual Ham responsibility, but we shouldn't depend on that. There is enough tools in a digi to force moderation.

While I don't think you will be able to get any of the APRS authors to take on any tasking or personal ideas; what you are proposing is something that would make a great theoretical paper, or even a scientific study. One that may even be adopted. That's where I would recommend that you use your energy.

Best Regards,
Steve/k5okc

It is not my desire to be a god. If I were, I would know everything about
everything, and with nothing left to learn, I'd probably be bored. One
could only spend so much time looking into Cameron Diaz's bedroom... My
statement was not that the issue was insignificant, or that I didn't care
at all. The statement was that the issue didn't interest me enough to dig
into the subject. I've learned I can't learn everything, I have to limit
my involvement in some areas in order to achieve the results I want in
others.

Today I did not say that these were bad or unworthy ideas, or belittle

them in any way. To save you the trouble of digging through messages, in the past, when I have voiced opposition to such proposals, it has generally been because my opinion is that such a networking scheme would be time-consuming to develop, expensive to deploy, and not result in enough benefit to the average ham to make them want to participate. I expressed those thoughts as my personal opinions and did my best to argue those points, but failed to convince you. I am no longer arguing these points, because to continue to debate is unproductive...I will never convince you, and to debate further would mean I would have to learn more about the subject, see the previous paragraph.

Anyway, I would, honest and truly, rather see you prove me wrong by developing a better system, than to convince you it cannot be done.

>It simply would be much easier to do this within the system as opposed

>

OK, but again, what is needed is concrete examples, not references to 10 year old papers. Develop a real protocol that implements these ideas, and present it. The test system need be nothing more than a couple ht digis and a few mobiles. No general concepts, vague references, or volunteering of other's labor. Results!

"The business model of Linux"? A handful of people with business savvy, smart enough to not alienate the open source community with promises and a few IPO shares, smart enough to ride the crest of anti-Microsoft sentiments, smart enough to con Wall Street into valuing companies that have never made a penny of profit in the billions, and finally, on their knees every night praying that the .com bubble doesn't burst before their lockout period ends.

Perhaps the Linux open source community is the example you wish to put forward. A group of people who code for the sheer joy of it, without worrying about the financial aspects, and producing a superior product. That's great, I'm all in favor (with actions and not just words), but there is a big difference between the Linux world and the APRS world. In Linux, the programmers are the consumers, while in APRS the programmers

are a distinct minority. And even in Linux, many good projects wither and die due to a lack of participation.

There are simply too few programmers in APRS to produce the critical mass that Linux has achieved. Look at aprsd...the source has been available for well over a year. How many people have contributed? What about xastir? I keep meaning to ask Frank if anyone has joined him on the project. (You there Frank?) Dozens of people were clamoring for an open source client, but once one was released they seemed to just blend into the woodwork. Most of them really wanted a free client, not an open source one. Even the Pic-E...several hundred have sold, but only a couple people have released new programs for it.

I say the answer to making the APRS community more Linux-like is to develop new talent, not to try to direct the efforts of those already contributing. I try very hard to encourage people to join in the fun, they do not know what they are missing.

>Many "hobby" or open source things rival or exceed the commercial world.

>

>Don't sell yourself short....

>

I'm not selling myself at all ;-)

The difference between hobby and commercial environment is not in the quality, and I never said or implied that APRS was in any way second rate to commercial systems. The difference is in the motivation of the programmers. I think we'd agree that love is a better motivator than money when it comes to coding. You have to love what you are working on to do an outstanding job, and that means the freedom to work on what interests you, not what interests other people.

> 8. Do we really need AX.25? At least redefine the APRS protocol so it is
transport
> method independent.

The obvious transport protocol would be TCP/IP, with probably UDP as the
datagram protocol. I think as long as you replace the Ethernet data-link layer
with
something relevant to Hams; such as AX.25, or any callsign based substitution
of source and destination addresses, the result would be an instant winner.

Given UDP, it would simplify some of the low level programming, as most OOP
languages have a UDP object already, and it is a standard protocol. There are
even various compression classes ready made.

This would also facilitate a cryptographically strong authentication, as it is
quite
easy to spoof, or steal/modify an APRS object currently.

The two books on my Ham desk are by Elliotte Rusty Harold, and published by
O'Reilly: Java Network Programming, and Java I/O. The network one is three
years old now, and becoming obsolete, but both provide enough information to
just about plug and play any transport mechanism your heart desires :-) I'm
sure C++ Builder or Visual Basic is similarly feature rich. The bad ole C days
are over. No more grow your own...

No, not at all. Remember, this is going over the air on a data limited channel.
The less overhead the better..... I think a tcp/ip frame has at least 40 bytes in
overhead.... if this was the only choice, I would stick with ax.25.

Or possibly are you suggesting pure IP over the air? There was a driver for NOS that allowed you to do this.

I was thinking something a little more micro controller friendly and more tailored to the data at mind. tcp/ip is a real challenge on a little microcontroller, although maybe we shouldn't be too worried about this?

But we are getting into specifics, I was more interested in what people want to do with AAVL. The specifics can come later.

For example, what are the primary uses of amateur avl/APRS? AVL, chit chatting, sending beacons, sending messages. If you know the order of importance here, you can use these items to help decide issues relating to the protocol.

> This would also facilitate a cryptographically strong authentication, as it is

This actually is quite a good idea. I think as APRS extends out past the ham market into the hacker market, people will appreciate these things more.

Open Source to me, as a minimum, has a CVS or like based method of making changes. If you must rely on the original author to fold in your changes, it becomes unwieldy. For example, I tried to submit some changes to xastir that would allow it to work with a non-linux system, but after two upgrades none of the code was used. I just assumed that the author wasn't interested, and I moved on. I did look into the possibility of developing the program in my own way, but having spent some time in X windows applications development, and Linux uses the ancient 1.0 Motif, you have to compare that to Visual Basic or Java as to where you want to go in life.

Most bought it to transport their GPS NMEA information. There really is a limited application for these. What are you expecting would develop? Cruise control interfaces? Maybe a city wide police radar detector emitter/dBm display... :-)

> I say the answer to making the APRS community more Linux-like is to

Well put. If you can't program, you can at least do basic research and publish something that others can enjoy. OK, I'll be quiet again now...

Best regards,
Steve/k5okc

Thats not my concern.

I'd actually rather here from you what you think APRS should be.... what is your
"vision" for it..... its evolution. This would frame any discussions of APRS
version
2.0 even better then specifics..

Thanks

40 bytes sounds like a lot at 1.2 kbps, doesn't really matter
at 4.8 kbps on up to 1.6 Mbps. We are talking about using
Proxim Symphony Spread Spectrum in our cars and central
nodes aren't we? :-)

Best Regards,
Steve/k5okc

>
> Thats not my concern.

Correct. 144.39 should be considered consumed. At 1.2 kbps there is
no room for other than minor changes.

Having played a bit with the 4.8 kbps soundcard stuff, I think this is the
way to go. You don't get into the problems of the G3RUH modem and
its down to DC requirement, although you still need to bypass the audio
filters (direct inject, discriminator take-off). This is the speed that most
Police use in their cruisers for data terminals, for example.

There's a lot of spectrum out there, and no use piling up with experimental
stuff that may never be as viable.

Best Regards,
Steve/k5okc

Here is something I wrote on the topic in PSR Isusue 56 October 1994:
"Proposal: A High Speed Multicast-capable Packet System for the 219MHz
Band" by Jeff King WB8WKA (but scales to other bands just as well)

Now, writing is all well and good, but nobody reads the stuff it appears.

Clearly, one must do more then write, one must be a RF expert and a software expert.

Again, I preface this as food for thought, and not any great desire to debate you.

First, one clarification.

Steve Dimse K4HG wrote:

> Yet you say these
> >same issues don't interest you.... Life ain't fair, is it?
> >
> It is not my desire to be a god.

It may not be, but you have a very high profile position in APRS. People tend to look to you for guidance...like it or not. With that comes some responsibility.

Anyways, lets get back to what I was saying, which I'm not sure was as clear as it should have been.

What is at hand required little RF networking knowledge, but a suggestion of "hooks" you could put into FINDU to improve RF messaging delivery at some future date. Hence my prefacing this discussion with "food for thought". I just want you to think about this as you are in the sole position (at this point in time) to implement this. Even if you weren't, your corporation would be helpful.

First the statement of issue.

1. You stated that for various reasons you felt it wise to limit the number of internet gateways.
2. I stated that I felt it better to embrace the internet, and have as many internet gateways as possible, even if they heavily overlapped.

Yet the issues you bring up, management issues, are good ones.

I am suggesting using FINDU to qualify internet gateways. That is, over time, FINDU (or the database) can determine who is on all the time, who has what RF footprint, and who is best able to deliver a message to a particular station. Basically to determine a "weight" in choosing who to IGATE a message to.

While I won't bore you with the technical details, this boils down to something called "least power routing" which is a common industry standard. In the case of hams, least power would boil down to try and reduce the number of digi's in the path. Not only is this good amateur practice, but it also increases the chances of getting a message through.

You target the message to the closet IGATE that has the highest "weighting" factor. This can be partially determined from the observed RF foot print from FINDU receiving as well as some self reporting issues like power and ERP.

Now, back to management issues. All this would be done automatically. The software would chose the best path to the station depending on the weighting information it evaluated. In this way, your "choice" of the internet gateway would not be based on arbitrary political considerations, but on sound engineering/performance data. If for example, a station wasn't full time, its weighting score would decrease. If a station was one or more digi hops from the messaging station, its weighting would decrease.

The whole point being here to reduce the impact on the frequency and increase the reliability of message delivery.

I realize this might be a bit complicated, but it is perfectly workable. I was just asking

you consider some of these issues in your design of "FINDU" so that someday it might be implemented. In programming terms, I was just asking for the "hooks", be it at your site, or remotely, be considered.

Also, other smart routing things might be considered eventually.

While your correct, I've had alot of ideas that go against your idea of what is practical, I don't think this is that outlandish... in particular since I'm just asking you to consider it in your design of FINDU and/or APRSERVE.

That's it. Agree or disagree, I've spoke my piece. A few other things.

> >Hmmm.....the business model of Linux keeps coming to mind. This
> >also tells me that more often then not, we are are own worst enemy.
> >
> "The business model of Linux"?

Nothing to do with IPO's. You misunderstand me. Its how Linux gets done and was in place long before any Linux IPO. Other then that, I think you got it.

> Perhaps the Linux open source community is the example you wish to put
> forward.

Yes.

> A group of people who code for the sheer joy of it, without
> worrying about the financial aspects, and producing a superior product.
> That's great, I'm all in favor (with actions and not just words), but
> there is a big difference between the Linux world and the APRS world.

Yes, indeed there is.

> In
> Linux, the programmers are the consumers, while in APRS the programmers
> are a distinct minority. And even in Linux, many good projects wither and
> die due to a lack of participation.

You really need to be fair. Up until a year ago, I'm told on the newsgroups, anyone that considered doing a APRS port was threatened with lawsuits (I think you might

have been the one saying this). To this date, there is only one open source APRS display application, and its still in Beta (and doing damn well).

> There are simply too few programmers in APRS to produce the critical mass
> that Linux has achieved.

In the context of the above statement, I consider APRS ONE YEAR OLD as May 1999 was the time the statement was made anyone could develop for APRS. When Linux was one year old, it was more MINIX then LINUX. It was just barely available then. Few even knew it existed.

> Look at aprsd...the source has been available
> for well over a year. How many people have contributed?

Don't know. Its a specialized application, with only 20-40 people running it so I suspect very few.

> What about
> xastir?

Judging by the development list, it appears quite a few have contributed. Some real sharp people on that list and the project seems to be moving along real nice. If you not on the development list, it is:

<http://okcforum.org/mailman/listinfo/xastirdev>

> I say the answer to making the APRS community more Linux-like is to
> develop new talent, not to try to direct the efforts of those already
> contributing.

Yes, but more so collaboration. I help you in areas you are weak, you help me in areas I am weak. And so it goes. I have a itch, I scratch it, that kind of thing. It all builds up. So far, the ONLY one who has adopted the model fully is XASTIR. And clearly it shows.

> I think we'd agree that love is a better motivator than
> money when it comes to coding. You have to love what you are working on
> to do an outstanding job, and that means the freedom to work on what
> interests you, not what interests other people.

I'm sorry I came off that way as I feel the same way you do. If I were to offer a idea
up you, I'd rather you say, yes that might be a good idea
then to come off trying to dictate what you should do. I don't think your saying
you want to work in a vacuum, so if I see a potential better way to do something,
how do you suggest I present it? (assuming I'm not capable of implementing it
myself)

This is not a few hooks, it turns the system on its ear. You propose taking the decision to IGate out of the hands of the individual clients and placing it in a central server.

>Basically to determine a "weight" in choosing who to IGATE a message to.

To determine this, you need to do even more modification to the system. The internet feed is heavily filtered of dups. The first one to APRServe gets through. The path of the packets can be different between first.aprs.net and second.aprs.net, each server does its own filtering. Your judging program needs to have access to all the dupes, this simply does not exist within the present system. It also needs to know which IGate recieved each packet, information which is not conveyed in the present system.

Next you need to get the information to an IGate that it is the designated IGate for a packet. You might do this in advance, continually broadcasting messages giving the IGate for each station, or wait for a packet to appear, then modify it with IGate info. The former is wasteful of bandwidth, the later means the judge needs to either be inserted in the stream or inject a flagged packet into the stream in such a way that it does not get filtered.

Each IGate program must be modified to accept commands from the judge, rather than make their own decisions.

You need to make the system redundant, so that internet messaging does not fail when the judge goes down.

>be implemented. In programming terms, I was just asking for the "hooks",
>be it at your
>site, or remotely, be considered.
>

If I'm missing an implementation that is really just a few hooks, please bore me with the details. I think this proposal would require a redesign of the network, a complete rewrite of APRServe, and large changes to every program that includes IGate code. Unless it was done right, it could easily decrease the reliability of the internet messaging.

* Make it an international standard. This would require at least:

- Support for international units in messages.

While the current situation using only imperial units is not as bad as it seems to be, since only by lucky coincidences (e.g. knots having greater resolution than m/s or feet having greater resolution than m) it is possible to transfer most measurements taken in SI units over a link using imperial units and display the values in SI units, without modifying the numeric value, provided that exactly the same conversion factors are used and exactly the same rounding rules are applied all over the network. Thus, the exact conversion factors and rounding rules should be clearly spelled out already in version 1.0.

However, other situations are not so lucky (e.g. measurements taken in km/h is transferred over link with mph, will not always produce a correct displayed result).

Thus, the unit should always be included in the message (even if it is a single bit telling that all measurements in this message are either SI or imperial) and each forwarding station should include this information and not modify the values. Only the final display station should do the conversion to the user selected unit, thus avoiding any unnecessary rounding errors.

- Support for non-US-ASCII characters.

The transmission medium must be 8 bit clean.

The problem is which character set to use. It would be tempting to use some version of ISO-8859-x, but this would require that the code page identifier to be included with each message carrying textual information. In border areas it would be quite normal to use several code pages.

It would be a better idea to go directly to Unicode and code it as UTF-8 for transmission. In UTF-8, the traditional US-ASCII characters would still occupy only 1 byte/character, but for other characters 2 or 3 bytes/characters will be required. It is clear that no application would be required to support the more than 40000 Unicode characters, but regional subsets can be created. For Europe, there are three defined subsets (MES-1, MES-2 and MES-3 with about 500, 2000 and

4000 characters respectively) that all support the Latin, Cyrillic and Greek scripts. A device not capable of displaying even these could use some fallback tables to convert the text to local 8 bit or even to 7 bit US-ASCII for displaying it.

This is a client program issue. It doesn't matter if the on-the-air protocol speed is in conch shells per lunar month, as long as everyone knows what the units are, and the client program converts it into units the user can understand.

I see no reason to complicate the on-the-air protocol. Suppose this were implemented...would you display the results in the units specified by the sender or convert some and not others so the units were the same? The former is much more confusing IMHO, the user expects a column of numbers

to be the same units. If you are going to display all in the same units, why allow both on the air? Easier to save a bit, and convert all or none as the user desires.

I wrote two magazine articles back in the early 90's. If you write it up magazine style, you don't really care, as you just want the \$50 per page...

What is attractive about APRS, is its simplicity. I use it because I like to keyboard chat, or keep track of WF6H-14 as he trucks across America, or follow KB4HRV's flights over Havana :-)

While I don't think there is any great need to modernize the programs, there are many areas, that now documented, show the limits of where it can/will be going. The igate can complicate things, but the current population is technical enough to manage their output, or if not, some local policeman will be sure to point you out at the next club meeting.

Best Regards,
Steve/k5okc

Provided that a suitable resolution is available in the transfer encoding and this has to do with the maximum value allowed. With too bad resolution, values can not be transferred transparently when using some specific source and display unit.

Assume a hypothetical speed encoding using unsigned binary values. Since Concord seems to be the only civilian object going over Mach 1, it would be natural to set the full scale to that speed. Thus, in an 8 bit system Mach 1.0 would correspond to transmitting numeric value 255, on a 12 bit system the max value would be 4095 and on a 16 bit system it would be 65535. Thus the resolution would be, when expressed in various speed units (use a fixed width font):

8 bit	12 bit	16 bit	
1.3	0.083	0.005	m/s
4.8	0.3	0.019	km/h
3.0	0.19	0.012	mph
2.6	0.16	0.01	knot

Clearly, the 8 bit system is inadequate, since you could not even get the unit digit correct in most cases. With 12 bits, speeds down to 0.1 m/s can be reliably transferred, which might be handy for tracking pedestrians, but the speed could only be reliably displayed to 1 km/h, 1 mph or 1 kt. With 16 bit, speeds with 0.01 unit resolution could be reliably transferred, which seems to be a bit of an overkill, unless you are tracking snails :-).

>I see no reason to complicate the on-the-air protocol. Suppose this were
>implemented...would you display the results in the units specified by the

That would be set by the user preferences in the display device.

Unless we are talking about intercontinental tracking, in practice the data generating device and the user display preference would be the same as the units used in that part of the world.

Simple, something that works.

Something that allows use of what we have until everyone chooses to upgrade. I'm all for advancing the state of the art. It is unbelievable what we can do with digital and HAM radio. We are using probably less than 10% of our VHF spectrum.

See my 1994 article using the input channels of VOICE repeaters to deliver over 3 Mbytes of data per hour and yet not impact voice users on these same repeaters. With over 50 such channels on 2 meters alone, that's 150 Mbytes per hour without asking for a single new channel from frequency coordinators, and the repeaters are still never more than 1 second away from normal use by any existing voice user.

All we need is people doing things. If you build something that works, people will use it.

As for APRS, it's only packet. AX.25, UI frames. It's nothing new since 1978. It's only an application. Do not try to burden it with all the "things that could be...". We can tweak it, optimize it, but any step function radical change will probably need to seriously address backwards compatibility, or move to a different frequency.

That's what APRS had to do. No way would APRS be tolerated on existing networks had it not been for the general demise of packet anyway. APRS was NOT WELCOME back in 1992 and objected to by most all packet guru's at the time. Therefore we spun our own network...

I suspect such is the way of life...

Bob, WB4APR

Thats why APRSdos uses LOG speed vectors for display and the compressed APRS format uses a LOG scale. It can resolve snail speeds and Concord speeds to the same geometric precision.

Right, that's why I called it future food for thought. Least power routing.

> This is not a few hooks, it turns the system on its ear. You propose

> and placing it in a central server.

But isn't this how it is done now? You decide who is the dedicated
Igate for an area? (in conjunction of course with a willing volunteer).

All I am suggesting is, eventually, a weighted lottery method based on a number of criteria that could be determined electronically be used. The intent here being the opposite of what you asked for... not to decrease the number of I-gates but to increase them.

The difference being instead of one selecting the I-gate, the system does this for you based on a number of criteria, location not being the only one. I-Gates are "awarded" for being on the air and available by having there weighting factor (chance they will be used) increased. I suspect, having played with mysql a little, it would not be to hard to use it to determine some of these weight factors already. (reliability being one of them)

This being for the purpose of implementing least power routing on our RF channel. I believe Tim Shepherd wrote a paper long these lines for is MIT thesis. Phil Karn is also a big advocate of this method.

> >While I won't bore you with the technical details, this boils down to

> To determine this, you need to do even more modification to the system.

Again, food for thought. That's all I was presenting it as. It was my feeling that the benefits were very attractive, in particular long term scaleability. But your right.... I'm not going to tell you what to do. Also, I'm not in a position to duplicate and write a "new" APRSERVE and FINDU. Its beyond my present capabilities. So I'll be silent on this aspect of it.

> Each IGate program must be modified to accept commands from the judge,
> rather than make their own decisions.

Oh, I understand that. That's what I meant by "hooks". I think the thing that is being lost, in particular those that are telling me to "do it myself" (a good point however) is APRS development really is a collaborative effort.... more so then almost any other amateur program. While NOS was also a networking program, they were able leverage off of the existing tcp/ip protocols and had a strong standards body directing the core effort (as does Linux in the form of the benevolent dictator Linux Tovads).

This has been my fundamental misunderstanding in these conversations since May. I'll try to correct this.

> You need to make the system redundant, so that internet messaging does
> not fail when the judge goes down.

Yes, of course.

> >be implemented. In programming terms, I was just asking for the "hooks",
> >be it at your

> bore me with the details.

Well, here are a few things that might be logged (and they may already be logged by FINDU) in determining a weighting factor. I'm also not 100% sure of the retry/routing method you presently use for messaging... is that documented anywhere?

Again, before I proceed, the point of this was to have MORE internet gateways to reduce the number of digi's needed to INCREASE channel capacity by implement a crude form of least power routing. That's it. Here are the hooks for the weighting database part of it. * means optional and not really needed

1. Geographic location of IGATE(s) hearing message
2. *Signal strength info from this IGATE (would be nice, but I know it won't happen)
3. Geographic location of user wishing RF message
4. Ground elevation of IGATE (user or DEM derived)
5. Reliability factor of IGATE (i.e. is it up each hour of each day?-- posits heard --)
6. ERP of IGATE (user entered)
7. Antenna height of IGATE (user entered)
8. *Crosscheck on Antenna height (direct posit derived... not used in calculation but as method
to roughly confirm antenna height so user doesn't "fudge" things... this could happen)
9. History of this I-GATE.... how many messages did it successfully deliver?

Now, one could simply start out with points 1 & 2 (chose the closest geographical pairs). I'd immediately start logging point #9..... this will catch the I-Gates who have there transmitters improperly configured (overdeviation etc) and one can reduce there weight. Now it starts to become more complicated.

Reliability also is a factor.... that is, how often is the I-GATE on the air? This is your reward carrot.... assuming a ham wants his station used as a I-GATE (the carrot) one logs over time if that station is on the air (no more then once per hour however

to stop them from increasing the posit rate). Lets say the ham has a 99% up rate. He gets a high weighting number. If he has a 50% up ratio, then the weighting factor is lowered. This may not be needed at all depending on your transport method for messaging on the internet (ack ack?). But still might be useful as you'd still be logging over the air stuff.... which is the bottom line.

Now, I don't think the above method really takes a complete rewrite, does it? You presently have a criteria you use to determine who to send a over the air message to be transmitted. All the above information is already available to you, or could be derived. If not, specifically what is missing from the system?

Points 2, 4 (ground elevation), 6 (ERP), 7 (antenna height) and the crosscheck are all used to implement least power routing more directly, and might be a more long term thing.

So instead of only considering only geographical location, one also factors in other things. Lets say for example one has two I-gates that heard the signal, and now one wants to transmit through one of them. Both are the same distance from the msg client and both have the same history and reliability factor.

So, which one do we chose??

With least power routing, the idea is to minimize the RF footprint so as to have less impact on outlying areas to improve frequency re-use. Just like CDMA does it. So lets say we want to see at least a 40DB S/N signal at our client (who by default is modeled as a mobile user). Factoring in the noise level, we need at least a S-9 signal for a BER of 10-4 or better. So we pick the biggest station with the highest ERP/height, right? Not necessarily. In this case, both are only 5 miles away and both stations would dramatically exceed the 40db S/N we set as our threshold. So in this case, we pick the I-GATE that has the SMALLER RF foot print (lower ERP/height). This has no effect on our messaging but it causes less interference to those in outlying areas. Meaning, we have both increased channel capacity and increased the reliability of the system.

> I think this proposal would require a redesign
> of the network, a complete rewrite of APRServe, and large changes to

> every program that includes IGate code.

Possibly and the reason I am calling this food for thought. Or it may be APRS simply won't scale any further. We've already received reports on the SIG on congestive collapse of some of the urban networks. So maybe its terminal already. But these are the issues one might consider now, if one can.... this is not another quick fix but a method to allow almost infinite scaling of the system (see Tim's paper). As the system evolves, if one makes these considerations ahead of time, implementing them will be that much easier.

>Unless it was done right, it
>could easily decrease the reliability of the internet messaging.

Maybe, but if one agree with the following two statements, then having more I-GATES, instead of less I-GATES might eventually make sense, assuming the system can handle it. Least power routing..

1. A close direct path , IF POSSIBLE, is more reliable then a long digipeated path.
2. The direct path has less impact on the channel, thereby allowing more users to be on the channel (no/less digi's means less transmissions and a smaller RF footprint)

Someone explained to me off-sig how I-Gate messaging worked from a internal perspective. In light of this, I completely agree with you.

This episode I mentioned was the first time I've ever done anything to manage who could and couldn't be an IGate. Even in this case, all I did was suggest the two people talk to each other. If they both still want to be IGates, I'll add them both. As I say, this doesn't affect the internet side, it affects the RF side. It is not my place to manage local RF nets.

The decision I'm talking though about is who transmits a given packet. Right now each IGate makes the call itself on each packet. Each IGate keeps track of who it considers local, and when a message appears to one of an IGate's local users, it sends it.

>The difference being instead of one selecting the I-gate, the system does

There is no infrastructure for collecting this information, nor any single place it can be acquired. It would require multiple modifications to most pieces of the present system.

<http://www.aprs.net/inetmsg.html>

There was also my DCC98 paper, in the proceedings or at

<http://www.aprs.net/vm/dcc98.html>

I hadn't looked at the first link in quite a while, interesting to note that a couple years ago I wrote that the server was "very popular", documenting more than 40 users at a time and 500 connects a day. Now the two servers support more than 300 users most of the time and 5000 connects a day! I wonder if it will increase 10 fold again over the next 2 years!

The routing method, if you want to call it that, is quite simple. Every IGate sees every packet, and if a station is local, it transmits the message. Local means heard in x hops or less, generally 2, which matches the WIDES in the outgoing path. Acks are end to end.

>...
>Now, I don't think the above method really takes a complete rewrite, does
>it?

For gathering this data, there still must be an infrastructure created that allows access to each packet without filtering, and that can identify the source of each packet. This means either creating a new system that runs in parallel with APRServe, or a big rewrite of APRServe to change the way it handles data.

>You
>presently have a criteria you use to determine who to send a over the air
>message to be
>be transmitted. All the above information is already available to you, or

Just to pick one of your unstarred criteria:

>9. History of this I-GATE.... how many messages did it successfully deliver?

This means the ACK from a client would need to identify which IGate it got the message from. The ACK protocol needs to be changed, and every client program, not to mention every D7 and D700, would need to be updated.

Of course, if you guarantee that only one station sends a message, then you can collect this info fairly easily, but the command/control system to cause single transmissions is entirely lacking.

>So instead of only considering only geographical location, one also
>factors in other
>things.

Geographical location is never looked at in the present system, it is a functional criteria. The target must be heard within x hops (generally 2) of the IGate within the last hour.

>
Right here is the greatest amount of work. First, you have to create this central judging program (with a redundant backup and a means for switching between them), then you have to somehow place each IGate under the control of this authority. I'm sorry, but this is not "just adding a few hooks".

This was the fundamental problem I had. I thought there was some mechanism in place to limit this. In essence, you are considering the whole network as one big ethernet segment, and whatever "bridge" hears the user, takes it in. Must be an absolute mess during band openings.

One question, in your paper at <http://www.aprs.net/inetmsg.html> you state:

>Potential Problems

>The biggest problem that may occur with the new IGating system is QRM.
>In its present implementation, no check is made for the existence of multiple

aware
>of who the other IGates are, and to coordinate with them.

As you did recognize this problem at that time, what did you have in mind to
fix it and why wasn't it implemented?

> The routing method, if you want to call it that, is quite simple. Every

Right, as far as APRSERVE is concerned, your talking to one big ethernet
segment. Of course, radio isn't one big ethernet segment. In light of
this, I agree with you that it would be completely impractical to change
APRSERVE..... even so, there still might be a chance to implement a
least power routing system, the focus now just changes to the I-GATE
stations.

Or is it your feeling this is impractical also?

> >So instead of only considering only geographical location, one also
> >factors in other

> of the IGate within the last hour.

OK, then the smaller "x hops" is, the higher the weighting factor. Would
this work? 0 hops (direct) being highest and so on.

Still, with APRSERVE being just one big ethernet segment, I don't see
how this could be communicated.

Oh well, maybe in the next life.

Not on a national level. The QRM is local, the issue is local. It would
be like the APRSWG declaring they would decide where all the digis in the
country have to be placed...
>
>As you did recognize this problem at that time, what did you have in mind to
>fix it and why wasn't it implemented?
>
The fix I thought of was random holdoff. If you are an IGate, after you
decide to transmit a message, you wait x+random(y) seconds...if you hear

the message on RF, you know someone else has transmitted it, so you don't. y would be decided based on the number of IGates and digis in an area, x would vary based on priority. This could be as simple as the presumption that IGates running aprsd are full time, and so have shorter holdoff, while clients like WinAPRS would have longer ones. More fraught with danger is to make it user-configurable. More complex would be to listen for other IGates and dynamically adjust the numbers.

Never got implemented because it never got high enough on the list. Lots of people complain about no IGate close enough to them, no complain reached my ears about too many. In any case, I only have control of APRServe, which provides IGate services to South Florida and SoCal only...

Yes but...

One of the problems is variable propagation. Say one IGate hears usually in three hops, but just happens to get a packet once by one hop. Not such a big deal when the reliable IGate 2 hops away will also send the message, but if you implement a control system to make only the best IGate transmit, then you need to be a lot more rigorous, perhaps

examining each RF packet and running a moving average on each station.
More work, and the trouble here is it must be done in parallel by at
least 4 different authors...

Yes..... that would work. One other mechanism to consider here is if the message comes through a second time (or more) the station that sent it goes to a slightly HIGHER holdoff, lets call this h . The assumption being is that the station that sent it didn't make it, so go with another station. If no other station exists, the one sending it the first time would still send it again, just with $x + \text{random}(y) + h$. H would only be set once per message. Everyone would get the same first shot at it, then the person that sent it steps to the back of the line.

Would it also be possible to weight this formula with the digi-hop number also?

> Never got implemented because it never got high enough on the list. Lots

> reached my ears about too many.

Well, as you said, you've had a 10x increase since 1997. Again, the paradigm has changed since then. Now we are seeing full time internet access at more and more ham shacks. So not only has APRS users increased 10X since 1997, I'd think those that have full time internet have also increased at least 10X. So we are looking at at least a potential 100X increase in potential full time I-GATES since 1997.

In any case, this sounds like a local I-GATE issue and not an APRS-SERVE issue. Would it be possible for you to submit your plan to the APRS-WG, assuming you formally wrote it up. This is not something someone can "go out and code". Everyone needs to adopt it in a similar manner for it to be effective.

Alternately, I guess they are getting this e-mail.

Anyways, thanks for the go around. It was very enlightening.

Maybe, but there has to be some point we move on. I'd think any upgrade
the cost under \$100 and offered substantial improvements might be
immune from the need to use 15 year old TNC's.

> , or move to a different frequency.

Question for you.... can those Kenwood radios receive at 9.6kbaud on 440
and at the same time the transmit and receive at 1.2kbaud on 2meters?

Thanks

-Jeff

It got removed from the APRSdos docs many years ago when I needed more room. But it is very simple. You stream data at 9600 baud from a voice repeater site by transmitting on its INPUT frequency. This is 9 packets at a burst. So for 900 ms you are streaming data, and for less than 100 ms the carrier drops and listens for anyone wanting to use the repeater.

Thus voice users are totally unaffected. They key their voice radio and within one second, the repeater hears them and they use the repeater normally. Whenever the repeater drops, it continues with the data feed.

The beauty is that it requires NO user mods. Every voice radio and voice user sees NO change. Yet for the 95% of the time that the repeater is idle, it is passing megabytes on its input frequency. (No one ever listens to the repeater input frequency).. Notice this is a one-way feed. Only the REPEATER itself can judge when the repeater input frequency is not busy. But this is exactly the way WEB pages work, 99% of the data goes one way.

The digital stations just capture everything. If a user needs to request a file, then his single packet gets transmitted on a common channel such as 145.01...

This idea got very little attention back then, because everyone was still thinking in terms of balanced two-way connect-type exchanges. But the WEB has changed all that... Now it is perfect!

I need some real examples of APRS compressed position data, to help verify that the APRS Protocol Spec is correct.

If you transmit your posits in compressed format, please send me some examples, together with the corresponding lat/long coordinates.

Thank you.

At one point, only APRSDOS was supporting the new compressed format.

Is anyone else supporting the compressed format?

WinAPRS?
APRS/CE?
XASTIR?
PALM/CE?
SA4+?
XASTIR?
UIVIEW?

Thanks

Easy way to tell. If you monitor for APRSTk satellite posts from anyone, they default to COMPRESSED. Also PCSAT is in compressed as well as my home station WB4APR... Might give you some samples to look for.

Look for objects with the names of U022, K023, K025, T031, etc..

Bob

Right, but I didn't want to run every application I listed to determine that.
Figured asking the SIG would be the quickest way to determine which
ones besides your support it

Maybe if I rephrase:

Which of the following AGPS GUI apps support decoding of the
COMPRESSED FORMAT:

APRSDOS - YES
APRSTk - YES
Kenwood radios - YES?
WinAPRS - ??
XASTIR - ??
APRS/CE - ??
PALM/CE - ??
UIVIEW - ??
SA4+ - ??
Others?

findu.com No, but high on the do-list. Anyone want to donate the C code?

APRServe No, but with findu map.aprs.net is not going to be supported,
not a priority. It will, of course, pass the positions just fine.

javAPRS No, no plans to implement unless I have to get back into the code
for some other reason

Steve K4HG

Hi All-

I am trying to output Tornado and Severe Thunderstorm Watch boxes from the Storm Prediction Center in Norman, OK - and I am have protocol questions.

1. On page 47 of the draft- in Chapter 11- the chart shows Object types 1 = line and 6 = colored line

Since you can define the color for all the types - whats the difference between a colored line and a line with color? This makes sense if 1= a line that needs to have its end down and to the right and 6= equals a line that ends down and to the left. This means that a "corridor" can only down and to the left. I can program around that if we are talking about a rectangle- but not all watch boxes are rectangles. I now need to goto 4 lines to define a box- not extremely efficient. The NWS is telling me that they are going to polygons- 3-4-5 or 6 sides maybe.

2. The last paragraph of Chapter 11 states that "Some stations transmit Object reports without the " ; ' APRS data type Identifier. This format is obsolete. Some software may still decode it, but this is not required."

Maybe so- but winAprs does not support it- so I will continue to output objects without the semicolon until everyone goes over to this format. If any software is not supporting "semicolonless" object I need to know so I can put it out both ways.

3. I cannot get winaprps to display any line.triangle,ellipse etc.- this could be a problem with my parser- but I am following the Spec as I understand it. However if there are programs that are currently supporting the spec on area objects let me know and I will begin to output the watch boxes.

4. There is a crying need for a multipoint format for polygons- for example: almost every tornado and severe thunderstorm warning has a polygon that is the "Area of Maximum Concern" which is the area the radar computer thinks is at greatest risk. How about a string of compressed lat/longs? Actually the NWS has it fairly compressed already I E
LAT...LON 3669 9495 3651 9497 3651 9418 3676 9417
this is in degrees and hundredths

Any help would be appreciated

73 de kg5qd Dale

Here is what I have so far:

>Which of the following AGPS GUI apps support decoding of the
>COMPRESSED FORMAT?

APRSDOS - YES
APRSTk - YES
Kenwood radios - YES?
WinAPRS - No (user reports compressed not decoded properly)
XASTIR - Yes
APRS/CE - ??
PALM/CE - ??
UIVIEW - ??
SA4+ - ??
FindU - No (real soon?)
APRSSERVE - "No" but this passes the reports just fine
JavAPRS - No, no immediate plans to add this.

My implementation of GUI-driven APRS, provisionally called "easyAPRS" will support compressed format. It will not transmit in compressed format, but will receive, decode, and display.

In article <LYR14779-77891-2000.04.16-07.56.51--Ian.Wade#care4free.net@lists.tapr.org>, Tj Johnston <n4uyq@arrl.net> writes
>What is the easiest way to determine if a packet should be processed as a
>compressed packet or not.?

'pends what you mean by "compressed".

In the APRS Spec, we distinguish between "encoded" (meaning Mic-E format) and "compressed" (meaning compressed format).

To detect a Mic-E packet, you have to look first at the APRS Data Type Identifier (the first byte of the AX.25 Information field). For a Mic-E packet, this will be either ` (back quote/grave) or ' (apostrophe).

` means it is a Current Mic-E report (except for the Kenwood DM700).

' means it is an Old Mic-E Report (except for the Kenwood DM700, where it means it is a Current Mic-E Report -- this is a bug in the DM700 firmware).

Hi All-

A correction to my earlier post concerning a semicolon for the first character of a object- it works just fine in WinAprs- the problem appears to be between my ears.

I am moving all objects created by my parser to using a semicolon- let me know if that causes problems.

73 de kg5qd Dale

In order to provide better operation of APRSdigi and a few other future programs,
I need to gather a little information from the multitude of APRS hams out there.

Many different types of cheap laptops and computers are being used for APRS.
I need to get a rough idea of what type of video and max resolution these may
have.
I dont want to waste coding space for rare types and resolutions.

If you get a chance, please send email to n4uyq@arrl.net

Let me know what Type:

MONO

CGA with color display (like the Tandy 1000 desktop series)

CGA with mono display (like the Tandy 1100 laptop series)

EGA with color display

EGA with mono display

VGA with color display (like most current laptops)

VGA with mono display (like the ruggedized APRS Terminals)

and the maximum resolution it supports.(ie: 640 x 480)

I believe this is the state that the Xastir code was last in. I contributed
the decoder for the compressed format, but didn't write an encoder. I
assume we're talking about the YYYYXXXX format.

You are correct. Both are colored lines, but being linear one dimensional lines, there is no concept of "FILLED with color". But they DO have WIDTH.

APRS can draw either of these lines at any angle and can then specify a line either side of that line. This matches the NWS descriptions perfectly of watch boxes extended X miles either side of a line between point A and point B. The format is noted in the spec to include the WIDTH parameter in the COMMENT field in BRACES as in {70} which would be 70 miles either side.

APRSDOS draws this as the original line from point A to point B and then an oblique rectangle box with the sides 70 miles to either side. The rectangle is drawn with dotted lines of the same color as the original line. The result is a RECTANGLE of any width or orientation.

Are you sure? The format using ";" is the only current format. The
format without the ";" was decided to be obsolete back in 1997. We first
implemented it in 1995 with the Sprouls concurrence. APRSdos, and any of
the kenwood products require the ";" and ignore the obsolete format.

Back in 95, I proposed a multipoint line drawing protocol and the Sprouls
agreed. But neither of us got around to coding it. My format was
scalable to any size. It included the LAT/LONG of the starting point and
then a SCALE, and then a list of X/Y offsets for each of the points. Thus
it could represent things as small as a few feet to as large as hundreds
of miles. I can dig for it...

By using an origin and base-91 offsets, then we could send polygons (or
contiguous line segments with as many as 40 points in a single 100 byte
packet.

An interesting thought... If you could have a LAT/LON and a sequence of vectors (length and direction) then it'd be a short notation for an object path... so tornado - hurricane paths could be displayed... hmmm interesting in the case of a hurricane if each segment equated to an hour in time...

Similarly, path of any moving object could be sent the same way... so folks could see the path of a balloon over 1 minute intervals... or a vehicle...

And, I could see some benefit in true tactical environments where intended paths were delineated in advance...

SCALE does not come into this particular capability... but it sure is a nice shorthand for previous and projected future paths of objects....

What I had originally proposed was before we began using BASE-91
characters and compressed format, so here is what I would propose today
using the existing ITEM format (compressed).

```
)NAME!\yyyyxxxx)SSSxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyxyx  
^^^^^^^^^^^^^^^^^^
```

WHERE this is just an ITEM named "NAME" in compressed format using
the symbol characters of "\)" (This is a currently undefined
SYMBOL). The YYYYYXXXX is the starting point anywhere on the
planet to the nearest foot.

The first 3 bytes in the COMMENT field for this ITEM is the
SCALE in base 91, giving a scale anywhere from 1 foot to
142 miles (per line segment)

The remainder of the line are any number of pairs of X/Y offsets
from each previous point. Each offset is a single
base 91 number with anything above 45 being positive and below
45 being negative.

The result then can be any multifaceted shape from a small scale of
about 1 foot per line segment up to an object 142 miles on a side.

NOtice that this is a completely legal ITEM. Its just that the SYMBOL (ICON) has this unique set of display rules...

de WB4APR.

Thus, I can transmit to you in ONE PACKET a complete MAP of the route from the nearest INTERSTATE to my front door in a single packet...

Bob

My problem with this is that as I understand your format... each segment is the same length... What I'm looking for is vectors... so azimuth and range... the vectors can change in length..... I have no interest in regular polygons... or having to try to fit regular line segments into a plane space where segments

differ in length... are you familiar with the tactical term "spider routes" ?

maybe that will help explain what I'm trying to reconcile your concept with...

I could even live with the range portion of the vector being a log scale like
muLaw is for telephone codecs...

Also... for the sake of internationalization... I'd whole lot prefer meters to be the
base distance measurement... I keep tripping on your "feet"... pun intended....

Good try... and I guess what you present here has applicability... and since
I'm not a coding guru.. we take what we get...

No, each segment can be any length it takes to get from one point to the next point. The only thing that is specified is the location of the next point (in values of X and Y) from the current point.

Hi All and Bob- Bob said-

>APRS can draw either of these lines at any angle and can then specify a
>line either side of that line. This matches the NWS descriptions
>perfectly of watch boxes extended X miles either side of a line between
>point A and point B. The format is noted in the spec to include the
>WIDTH parameter in the COMMENT field in BRACES as in {70} which would be
>70 miles either side.
>

I must be missing something- If the "corridor box" is defined as a point
with a "down and to the left" offset- then what if you need a "down and to
the right"? drawing it backwards would give you a negative up-down offset-
The NWS gives you the lat/long for the corners of the box- this can be
reliably parsed whereas I'm not so sure about finding the two reference
points and converting from verbal to lat/long.

>
>Are you sure? The format using ";" is the only current format. The
>format without the ";" was decided to be obsolete back in 1997. We first

Yes I am sure I was wrong- works fine in Winaprs--

>Back in 95, I proposed a multipoint line drawing protocol and the Sprouls
>agreed. But neither of us got around to coding it. My format was
>scalable to any size. It included the LAT/LONG of the starting point and
>then a SCALE, and then a list of X/Y offsets for each of the points. Thus

>
>By using an origin and base-91 offsets, then we could send polygons (or
>contiguous line segments with as many as 40 points in a single 100 byte
>packet.

I like the concept of this- however the 140 mile limit for length of side

would be combersome for watch boxes- could the scale be changed for some predefined watch box object?

Thanks for the help

APRS has two line OBJECTS. One is down and to the left. The other is down and to the right. From these two, we can draw a LINE at any angle anywhere. Then, if you put a WIDTH in the comment field, then APRS draws two additional parallel lines that width to either side and then connects the end points. The result is a rectangle of any size you want at any angle you want.

> The NWS gives you the lat/long for the corners of the box- this can be

The above RECTANGLE is the way NWS used to report watch boxes. "in an area XX miles either side of a line between point A and B"... Their new method simply needs to be converted to that format. Simply take the midpoint between the 1st and 2nd points and let that be the OBJECT LAT/LONG (point "A". Then compute the midpoint between, the 3rd and 4th point, and that is the "point B" that you use to define the original line. Then compute the WIDTH of the box (the distance between the 1st and 2nd point divided by 2) and you have what you need to do any box with existing APRS...

If you chose the 140 mile scale, then each segment could be any length from 3 miles to 140 miles in increments of 3 miles. If you need smaller boxes, then choose a smaller scale factor. If you need larger boxes, then define each side to be many segments. Say 3 segments each. Then your box could be 420 miles on a side accurate to about 9 miles.

I admit that going to multiple line segments on a side is cumbersome. How about if we defined the SSS scale factor to be in Meters. Then the range of scale would be from 3 feet to 420 miles before you would have to go to multiple segments.

I think everyone would prefer METERS anyway...

BETTER IDEA: The offsets and scale should all be done in terms of
LAT/LONG (not meters) to avoid any complex spherical trig functions. If
we let the units be in terms of .000001 degree of LAT/LONG, then we get
approximately 1 meter precision. AND since this is just a "shape" then if
we define the symbol character of ")" to be a polygon then it can be
transmitted in ANY existing APRS POSIT, OBJECT or ITEM report.

So the format would be:

- * ANY POSIT, OBJECT or ITEM defines the origin of the polygon
- * SYMBOL of "\)" indicates it will be a polygon
- * Comment field format is then:

CSSSxyxyxyxyxyxyxy...

Where C is the color 0-15 (or 16-32 means FILL the polygon)
SSS is the scale factor in units of .00001 degree of lat/long
xy are offset pairs between each subsequent point

Thus the following comment field on an OBJECT located at 3847.04N
07710.53W could completely define the Washington DC BELTWAY:

+\$<S2L8U6N=WBZGcRYR\UQaGyUUQ\CSINKTJOLQEWGOJMJPJM?PEHIC
Where + is the color 10
!\$< is for a scale factor of 300
S2L8U6.... is the beltway!

Another example would be that I could use that SYMBOL for my home station
and the line segments could trace out a PATH from the nearest interstate
exit to my front door... for when someone is visiting and looking for me
for example...

Hi Bob and all-

I see my problem- I was going by the draft spec- according to it the only line object that has a "width" definable is a type "6" - down and to the left. If a type "1" can have a corridor then I can get there from here.

Bob Said-

I think you are testing the internal DIGI inside the D700?
Yes, it will respond to the SSID routing and to DIRECTIONAL ROUTING...

There are 4 paths for directional routing, NPATH,SPATH,EPATH,WPATH
I am glad you are testing these.

Bob, WB4APR

But it would not surprise

Hello Bob, thank you for the message, I'm testing the D700 features, and I've also implemented it in my digipeater TNC2 firmware named UIDIGI and now we are experimenting this routing method in my local area (North East of Italy).

I never see any information in the APRS Protocol specification, so I've tried to understand the routing rules testing the D700.

Bye.

Marco IW3FQG

k

The original docs are in the README\DIGIS.TXT in all distributions of
APRSdos...

My sole point was that the term "official" program is not correct especially coming from Bob. I mentioned the WG simply because the WG (of which Bob is a founding member) is not supposed to call anything official. There are a bunch of windows program now and soon available, so calling anything "official" is wrong.

It would help if the WG clearly said, "No program has exclusive recommended

or "official" status with the WG. All licensed programs are viewed equally.

I will give the benefit of the doubt and ASSUME that the "official" was a carry-over from the days when Bob closely controlled licensing for APRS programs. Those days are over, right? If anything is answered here, that question should be!

As a reminder, I am no longer a member of the APRSWG, these comments are strictly my own...That said, I think this discussion is way out of line. Gee, imagine me with a strong opinion ;-)

I thought all the discussion last year had made the issues the APRS WG adressed clear, but either I was mistaken, or memory has faded over time.

>My sole point was that the term "official" program is not correct especially

The Charter says exactly the opposite, that pre-existing deals are not affected by the formation of the APRS WG.

There are contracts between Bob and other authors that must be honored, the formation of the APRSWG does not change these legal documents.

Indeed, the clause is in the charter specifically because of these contracts, the APRS WG could never have been formed without this clause.

No one ever said that all APRS versions are equal. Bob has a registered trademark on APRS. He can use this in any way he sees fit, and make any deals involving it he chooses.

My point in creating the hubbub last year at this time was never that Bob does not have a right to this trademark. He does, absolutely and totally, and I am completely behind this. You cannot use the term APRS without Bob's approval. To the best of my knowledge, he allows all developers that are not charging for their software to use it without charge, but he is under no obligation to do so. He is absolutely, legally free to call anything he chooses "the official APRS version".

What I objected to was that this trademark somehow applied to the protocol, or that the protocol could be copyrighted. Innovation and competition was being stifled without a legal basis in my opinion. This was my objection, and opening APRS development to all was what the APRSWG is about, not about stripping Bob of his legal rights to his trademark. The number of new software releases over the last year have been the result, and a very positive one. Just don't go trying to make the APRSWG more than it is...all versions of APRS-compatible software are not equal!

I can hear the objections now...this is ham radio, you can't (or its not right to) make money. Well, no one whines that Kenwood, Yaesu, et al make money, no one whines about AES or HRO. It always makes me mad that people think software is different. Just because the product is shipped by electrons alone (unlike Kenwood's products that require attached nuclei) does not change anything. Indeed, the failure of the public to recognize this has resulted in a new software copyright law that significantly impinges on all our freedoms. If you didn't know, those shrink wrap licenses are now legal, you do not own your software any longer, the manufacturer can force you to stop using it when they choose.) I choose not to charge for my software and services. That is a personal choice, which I am free to make, as are others. But I will defend to the death the rights of other software authors to choose a different path.

It was very traumatic getting the developers to agree to the concepts expressed in the APRS WG charter. Bob did not agree with my opinion that the protocol did not belong to him, and we both had gotten legal opinions that told us what we wanted to hear (big surprise!). Bob very graciously agreed not to press his claim, and to open development up. Please, don't try to strip him of property that is undeniably his, the APRS trademark.

Hi Steve:

Thanks for the good review of last May's agreement. Your 100% correct, these things have been discussed before. However, I want to point out a fact that was missing. But first one point you raised.

Steve Dimse wrote:

> Please, don't
> try to strip him of property that is undeniably his, the APRS trademark.

Did Thomas ever suggest this? Serious question, I didn't see this so maybe I missed it. I think he is confusing the APRS trademark with the term "APRS certified, which was promised, but has not yet been implemented. I don't think he is trying to deny the property of anyone, but is making a understandable mistake.

Now as to the history lesson, it appeared factually correct. Yet we have to visit this thing called "appearances" once again. When the WG was formed, it consisted of 2 TAPR reps, and all the APRS Bob licensed (past and present) authors. Neither the author of UI-View or XASTIR was asked to be on the WG. In fairness, this was brought up on the SIG at about that time, and it was explained away as neither of them had "asked" to be on the WG.... it had nothing to do with them not being a Bob approved author. OK, but I later found out that some authors on the WG were indeed recruited, so this "asking" thing kinda seemed a little hollow to me at the time.

Now fast forward to the future. With you leaving the WG, the only authors sitting on the WG still are Bob licensed APRS authors. I guess no-one asked, right? The "appearances" still are here, even though our choices of "unlicensed" APRS authors has increased 4 fold. In addition to XASTIR and UI-VIEW, we now have at least 10 other people writing APRS type code.

While no-one may have "asked" to join the WG, it might be best for appearances that the APRS-WG try and recruit a new member that has proven "OPEN SOURCE" type mindset to replace your departure. It could only benefit the long term growth of APRS.

In my eyes (and I'm NOT putting words in Thomas's mouth) this is how *I* read what Thomas posted. That the closed mindset still exists..... it was not a smoking gun, but just the general attitude of us vs. them. Maybe he read too much into it, but I think the point was valid in May of 1999 and is still valid today.

I read tthis as saying that Bob has no right to call a program
"official", which certainly implies that Bob does not own the term APRS.
The "Official Windows APRS" label is something that is part of a contract
that existed long before the APRS WG, saying Bob can't do it means

voiding the contract, depriving Bob of the rights to his trademark as well as income from the licensing deal. This is wrong. The trademark is his to use as he sees fit!

>Now fast forward to the future. With you leaving the WG, the only authors

TAPR is not a licensee of the APRS trademark, and it still has a seat on the APRS WG, currently occupied by Greg Jones.

I think the theme of his message was MINDSET. He never said "Official Windows APRS" he said "official".

My *point* was you could just as easily confuse "official" APRS-WG certified license with "official" APRS trademark. As the former has been promised, but not implemented, why are you so sure he is referring to the trademark?

He never mentioned trademark. Instead of both of us guessing, why don't we see what he says? Or maybe he is the only sane one among us and gave up long ago on this thread...

```
> >Now fast forward to the future. With you leaving the WG, the only authors
> >sitting on the
> >WG still are Bob licensed APRS authors.
> >
> TAPR is not a licensee of the APRS trademark, and it still has a seat on
> the APRS WG, currently occupied by Greg Jones.
```

And your point?

Yes, I am aware of this and stated it in my message (which you didn't quote). Greg Jones of TAPR brokered the formation of the APRS-WG. He and John Ackerman, also of TAPR, were given seats on the WG along with the other Bob licensed APRS authors.

But neither Greg nor John are APRS authors, licensed or otherwise (that I know of).

More to the point, would you care to comment on what I was saying, that we should encourage the APRS-WG to have non licensed APRS/OPEN SOURCE authors/types sit on it? I thought you would be supportive of this..... maybe not?

This really is going nowhere, nothing against you, but these things were beat on time and time again back in the May-June 1999 time frame. No one gives a damn, other than an incredibly small percentage of the TAPR membership, so I'm fooling myself if I think they do (I'm serious here).

Elvis has left the building. ;-)

Please read the WG charter again. The certification committee of the WG
issues an "APRS Certified" label. As of when I left the WG, none had been
issued to any program. The word "official" only occurs once in the
document, in a completely unrelated context. There is no "official"
APRS-WG License, just the "APRS Certified (TM)" label. The "Official"
designation is a pre-existing one, and must be honored under the terms of
the APRSWG charter.

>More to the point, would you care to comment on what I was saying, that we

When I left the APRS WG, I made a recommendation of people I thought
would be appropriate to replace me, and I told several other people of
that opinion as well. I did so in private, as is my right, and it is a
topic I choose to continue to remain silent on publicly. I do not think
it is my right as a resigning member to choose my successor, or to
publicly campaign for anyone. It is up to the APRSWG to choose if, and
who, to add to their roster in accordance with their charter.

Steve K4HG

Your take is pretty much correct. Bob's reference to WinAPRS as the
"official" Windows version is related to the fact that it is the only
one that he (Bob, not the WG) has licensed to use the APRS trademark,
which Bob, not the Working Group, owns. That agreement was in effect
long before the Working Group existed.

>From the WG's perspective, there is no "official" APRS version for any
platform.

We hope that there will be a certification program that will allow developers to obtain an "APRS Certified" (or something similar) designation if their programs meet the requirements of the protocol spec. That program will be open to all comers and there could be many "APRS Certified" implementations for a given platform. But that certification trademark will be different from the right to use "APRS" in a product name, which Bob continues (rightfully) to control.

Hello, All...

As of late, there have been a number of suggestions that someone should fill Steve Dimse's position on the WG and that person should have an "open" orientation.

I would like to offer myself for that position. I have communicated with Bob and he appears to have little problem with my "application".

I am approaching this as a software author who is trying to bring into existence code based on the APRS standard. I have no allegiance to anyone's previous implementation nor any particular criticisms with any of them (other than the view that most are too complex to configure).

I would bring a pragmatic view to the WG. I tend to work as a bridge builder.

My own background is Electrical Engineering. I have a PhD from Colorado State (1971). I have worked at Tektronix designing oscilloscope plugins, at the College of Oceanography of Oregon State Univ. as an instrumentation engineer, and currently at Kalatel in Corvallis, OR, as an analog circuit designer and embedded processor programmer (8051 & AVR).

Non-professionally, I've enjoyed Macintosh computers and have done some Pascal, C, C++, and now visual-basic on that platform.

I've been a ham since about 1980 with a TechPlus most of that time. Packet has been my passion since getting that TechPlus. I have been involved in a variety of low-level networking protocol designs, professionally, and have been working with APRS for close to a year.

Most sincerely,
Jim Wagner, KA7EHK
Tangent, OR, USA

I'd like to see Version 1 of the protocol published ASAP. I know Ian is working hard on doing just that. I would hate to see that postponed or prolonged by any new dynamics within the WG. Version 1 is long overdue as is.

My suggestion is get Version 1 published first, get that done and out of the way, then the decks would be clear to focus on WG membership and other issues (like Version 2).

73, Cap KE6AFE

Hi Cap. The spec for Protocol Version 1.0 is almost complete, and the
Working Group are now checking it out prior to public release.

With luck you will see it "Real Soon Now"!

Hi All,

I have a code base for experimenting with APRS using HP200LX (XT DOS)

and Baycom modem that I am willing to make public. However, I don't think there being too much interest in this kind of setup as I am not aware of any one else using my program since I published it. Some interesting info:

<http://www.geocities.com/CapeCanaveral/Hangar/9412/>
<http://www.geocities.com/CapeCanaveral/Hangar/9412/airp/>
<http://www.geocities.com/CapeCanaveral/Hangar/9412/airp/Airp1.htm>

Note: this program makes no attempt to comply with the APRS standard but only as an experimentation vehicle for accessing the APRS network.

Alfred

Hi Cap and the gang --

I think the protocol spec is not far off, and I personally (not speaking for the WG) agree with you that it would be a mistake to make changes before that step is finalized. After the spec comes out, the WG will need to shift its thinking from documenting what is, to helping define what will be, and that will be the time to consider new members.

I hope that time will come very soon now, but I'd better let Ian speak for himself. :-)

I for one, second the nomination. Jim has been the guy who has

asked the best questions of the current spec, pointed out the completely bogus, and I think the final specs will be better from his contributions.

I think we should be careful about how many PhD holders are in there though (I'm kidding!)

Steve/k5okc

For testing some new APRS software, I need a Win95 telnet client that:

- a. will save all dialog to disk
- b. will not line wrap or truncate at 80 characters

c. will not drop any non-printing ASCII characters in the range 0x00 to 0x7f.

Pointer(s) anyone?

If I am not mistaken, HyperTerminal meets your requirements. However, I
am talking about the Windows 98 version - I'm not sure if the Win95
version has the telnet piece built-in. (I've used HT frequently to collect
a data stream from APRServe to feed to APRS/CE. The vanilla Windows telnet
client wraps at 80 columns, rendering a large part of the data stream
useless - though I guess it is useful to see how to gracefully handle bad
data.)

(I hope you folks don't mind a comment from an "unofficial" author ;-)

There is an obvious difference between the behaviour of ARPSTK and the APRS spec in terms of encoding/decoding compressed position reports.

The difference isn't great in absolute terms, but it is certainly highly significant in the context of the claim in the spec that an advantage of compression is "Improved position to 1 foot worldwide." The difference between decoding the same compressed posit according to the spec and decoding it in ARPSTK using my location as the sample data is about one mile.

Is there an error in the spec? (I'm using aprs101g.pdf.)

That's exactly the problem Rob! I wrote a simple joinline program in
Basic to join those lines which wrapped around at 80 characters -- the
problem is, if a line is *exactly* 80 characters long (and many are) I
then have to manually split the join I've just made. This is a veritable
pain in the subroutines when you're handling a 14000 line file (as I was
this morning...)

I'll look into Hyperterminal. Thanks Rob.

Does it have to do the Telnet option negotiation, or just open a TCP
connection?

Is it ok if it truncates the display to 80 cols, but saves the untruncated
dialog to disk?

Paul (K17JG)

If you've got Perl 5.something installed on the box, I can send you
a VERY small Perl script that implements telnet. I use it to connect

to the APRS feed and log packets of interest. It has NO rules for data mangling, but you can add your own if you wish. What you see is what you get.

APRServe does not appear to try to negotiate telnet options. (I don't think APRServe responds to telnet option negotiations, either.)

Good question. Or Could be in APRStk? How about sending us your
posit data, and the posit generated by APRStk so we can see whats going
on. Thanks. Wouldn't surprise me if a bug crept into the eastern
hemisphere..

Here is a sample for my office position...

LAT	LONG	YYYYXXXX
-----		-----

3859.11N/07629.11W => :h_!;/n!

I hope thats what everyone else gets. All versions of APRS dos can display the compressed format of any location of the cursor. Just hit MAPS-PLOTS-FORMAT and it will display the YYYYXXXX value in the upper left corner.

Bob

(Hope this works! The server that hosts my domain is down and all my incoming email is being bounced, so I'm sending this from the TAPR web site.)

You don't really need the example for my location, because, if you feed the example compressed posit in the spec - 5L5L<+%A which is supposed to be 4930.00N, 7245.00W - into APRSTK, it decodes it as 4929.71N, 7244.23W.

If you input 4930.00N, 7245.00W as your lat and long in APRSTK, there is a similar difference when it encodes the posit. It transmits 5L!!<*e!, which, when decoded according to the spec, is 4930.29N, 7245.78W.

Roger - G4IDE

5L!!<*e! decodes to 4930.00N, 7245.00W in APRS+SA.

APRS+SA decoder: 'NW' FmtLL ® LLCompress '5L5L<+%A'
N49°29.707' W72°44.223'
APRS+SA decoder: 'NW' FmtLL ® LLCompress '5L!!<*e!'
N49°30.000' W72°45.007'

Apparently, the spec is wrong.

Brent

So is anyone going to suggest in what way it's wrong? It only takes a few minutes to work through the example maths in the spec, so presumably it should be a simple task for someone to say where the error is...
